SEYCHELLES, sā-shĕl′; -shĕlz′, islands, Indian Ocean, belonging to Great Britain. This 92-island group (area 156¼ square miles), is about 1,000 miles east of Mombasa, Kenya Colony. Victoria, the capital and chief port, is on Mahé, the largest island of the group (56 square miles). The principal crops are coconut, cinnamon, patchouli, and vanilla. Guano deposits are worked, and turtles, and the yolks of birds' eggs are collected. In 1951, the Colonial Development Corporation, a British government enterprise, were financing a fisheries project. Fish obtained on the banks between Seychelles and Mauritius, were dried and salted on St. Anne Island and then exported to East Africa.

There were 34 elementary and primary schools in 1950 (government 27; private 7); three government secondary schools, and one vocational school. Highways on Mahé in 1950 totaled 118 miles about 88 miles of which could be used by automobiles. Steamships between Bombay, India, and Durban, Union of South Africa, called monthly at Victoria.

History and Government.—The Seychelles were discovered by the Portuguese and first colonized by the French (1743). The islands were occupied in 1810 by the British to whom they were ceded by the Treaty of Paris in 1814. The government is administered by a governor, assisted by a six-member executive council. The population in 1950 was estimated at 35,703 which comprised descendants of early French settlers, Africans (mainly descended from liberated slaves), a Creole class, and a few whites.

SEYFFARTH, zī-färt′, Gustave, American educator and Egyptologist: b. Uebigau, Saxony, July 13, 1796; d. New York, Nov. 17, 1885. He was professor of archaeology and exegesis at the

Concordia Lutheran Theological Seminary, St. Louis, 1855–1871. He then retired and lived in New York. He was a lifelong student of Egyptology and made many translations. He was the author of *Theologische Schriften der Alten Aegypter* (1855); *Summary of Recent Discoveries in Bible Chronology* (1857); *Chronologia Veterum* (1871).

SEYMOUR, sē'mōr, a noble English family of Norman origin. Their name is corrupted from St. Maur, their seat in Normandy. They acquired lands in Monmouthshire in the beginning of the 13th century and early in the 15th century added to these estates others in Somersetshire.

The first member to become conspicuous was SIR JOHN SEYMOUR, the father of the third wife of Henry VIII and of Edward Seymour, protector of the realm of England during the minority of Edward VI, whose uncle he was. He commanded in a maritime expedition against the Scots in 1544, when he landed a body of troops at Leith and set fire to the city of Edinburgh. By the will of Henry he was nominated one of the council of regency during the minority of Edward VI; but, not content with his share of power, he procured for himself appointment as governor of the king and protector of the kingdom (January 1547). In the month following he obtained the post of lord treasurer, was created first duke of Somerset and made earl marshal. The same year he headed an army, with which he invaded Scotland, and after having gained the victory of Musselburgh returned in triumph to England.

His success excited the jealousy of the earl of Warwick and others, who procured his confinement in the Tower. Six months after he obtained a full pardon from the king and was ostensibly reconciled to his adversary, Lord Warwick. The reconciliation was probably insincere, as Warwick caused Somerset to be again arrested, in October 1551, on the charge of treasonable designs. He was tried, found guilty, attainted and beheaded on Tower Hill in January 1552. His eldest son by his second wife was created earl of Hertford by Elizabeth. The earl of Hertford under Charles II having distinguished himself in support of the royal cause during the Parliamentary war obtained in his favor the revival of the title of duke of Somerset and took his seat in the House of Lords as second duke in 1660.

SEYMOUR, Charles, American educator and historian: b. New Haven, Conn., Jan. 1, 1885. He was educated at Cambridge and Yale universities, graduating from the latter in 1908. From 1911–1915 he was instructor in history at Yale, from 1918 professor, from 1927 provost, from 1937–1950 president of Yale University. He was chief of the Austro-Hungarian division of the American Commission at the Paris Peace Conference in 1919, and was also on the commissions for other countries.

He has written *Electoral Reform in England and Wales* (1915); *The Diplomatic Background of the War* (1916); *Woodrow Wilson and The World War* (1912); *American Diplomacy During the World War* (1934); *American Neutrality 1914–1917* (1935). He was editor of *What Really Happened in Paris* (1921) and *The Intimate Papers of E. M. House* (1926–28).

SEYMOUR, Horatio, American statesman: b. Pompey Hill, Onondaga County, N. Y., May 31, 1810; d. Utica, N. Y., Feb. 12, 1886. He was educated at Geneva Academy (now Hobart College) and at a military school at Middletown, Conn.; studied law at Utica and was admitted to the bar in 1832. In 1833 he became military secretary to Governor Marcy and held the position six years. He was elected to the State assembly by the Democrats of Oneida County in 1841; was mayor of Utica in 1842; re-entered the assembly in 1843 where, as chairman of the committee on canals, he outlined the policy subsequently followed by the State. He was chosen speaker in 1845 and nominated for governor in 1850, was defeated by Washington Hunt, but in 1852 was elected by a large majority. During his term a prohibition law was passed by the legislature and was vetoed by him as unconstitutional. The strong temperance sentiment prevalent at the time made his act very unpopular. During the term of his successor the vetoed law was again passed by the legislature, but was declared unconstitutional by the Court of Appeals. He was again elected governor in 1862 and made an unequivocal declaration in favor of the supremacy of the Constitution and the restoration of the Union, though he denied that the war was the unavoidable result of slavery, or that slavery should be abolished in order to restore the Union. In July 1863 serious riots broke out in New York, involving loss of life and destruction of property. These were caused by the draft-law which discriminated against New York City in the allotment of quotas. The governor's complaint to the President secured an investigation which resulted in procuring a correction of the errors of the enrolment. In 1868 he was nominated for the presidency, but was defeated by Ulysses S. Grant, receiving 80 electoral votes to the 214 cast for Grant.

SEYMOUR, Jane, queen of England: b. England, 1509?; d. Hampton, Oct. 24, 1537. She was the eldest child of Sir John Seymour and sister of Edward, Duke of Somerset and Protector of England. She became the third wife of Henry VIII (q.v.) and the mother of Edward VI (q.v.). She was the first maid of honor to Anne Boleyn, whom she supplanted in 1536, and favored the Protestant Reformation.

SEYMOUR, Thomas Day, American classical scholar: b. Hudson, Ohio, April 1, 1848; d. Dec. 31, 1907. He was graduated at the Western Reserve College in 1870 and later studied at the Universities of Leipzig and Berlin. He was professor of Greek at Western Reserve College in 1872–1880; and chairman of the managing committee of the American School of Classical Studies, Athens, Greece, in 1887–1901. He edited the *College Series* of Greek authors and was American coeditor of *Classical Reviews*. Author of *Selected Odes of Pindar* (1882); *Introduction to the Language and Verse of Homer* (1885); *Introduction and Vocabulary to School Odyssey, Eight Books* (1897); *School Iliad, Six Books* (1889–1901).

SEYMOUR, Thomas Hart, American legislator and diplomat: b. Hartford, Conn., 1808; d. there, Sept. 3, 1868. He was educated at a military academy at Middletown, Conn., became a lawyer at Hartford, and was editor of *The*

Jeffersonian Democrat in 1837. He was a member of Congress in 1843–1845, served through the Mexican War, rising to the rank of colonel, and in 1850–1853 was governor of Connecticut. He was presidential elector in 1852; was United States minister to Russia in 1853–1857, and during the Civil War acted as leader of the Connecticut Peace Democrats, in which connection he lost much of his popularity. In 1862 the state senate voted that his portrait, with that of Isaac Toucey, should be removed from the chamber till the comptroller should be satisfied of his loyalty. In 1863 he was again a candidate for governor but was defeated by W. A. Buckingham.

SEYMOUR, Truman, American soldier: b. Burlington, Vt., Sept. 25, 1824; d. Florence, Italy, Oct. 30, 1891. He was graduated from West Point in 1846, fought in the Mexican War, and was brevetted captain. In 1850–1853 he was assistant instructor at West Point, served in the Seminole War of 1856–1858, and under Major Anderson at the defense of Fort Sumter in 1861, receiving the brevet of major in recognition of his services. He became chief of artillery in McCall's division of the Army of the Potomac in 1862, and was commissioned brigadier general of volunteers. He was engaged in the Virginia and Maryland campaigns, was in command of a division at Malvern Hill, Manassas, South Mountain and Antietam, receiving rank of brevet colonel. As chief of staff to the commanding general of the Department of the South in 1863 he led a division on Folly Island, took part in the attack on Morris Island and commanded the unsuccessful assault of Fort Wagner on July 18, in which he was severely wounded. He commanded a brigade in the battle of the Wilderness, was taken prisoner, and after his exchange in the following August was in command of a division in the Shenandoah Valley, and was engaged in the operations around Petersburg until the close of the war. He was present at Lee's surrender. He was brevetted major general of volunteers and brigadier general in the regular army, and in 1865 was mustered out of the volunteer service. He became major of artillery in 1866 and served in command of various forts until his retirement in 1876. After his retirement he resided in Europe.

SEYMOUR, town, Connecticut, in New Haven County, altitude 160 feet; on Naugatuck River; on the New York, New Haven and Hartford Railroad; by rail, 12 miles south of Waterbury. In 1802 Col. David Humphreys (q.v.), who was the first to import merino sheep into the United States, started at Seymour the first woolen mill of major size. This early industrialist was also a philanthropist, endeavoring to improve the lot of the workers. The impetus he imparted to the town's development has persisted, and it is today a busy manufacturing center, making woolen goods, paper, wire cables, textiles, tools, hardware, and articles of rubber and of brass. Previously known as Humphreyville, upon incorporation ás a town in 1850, the place assumed its present name, in honor of Thomas H. Seymour (q.v.), who at that time was governor of the state.

The government of the town is administered by a board of selectmen. Pop. (1940) 6,754; (1950) 7,832.

SEYMOUR, city, Indiana, in Jackson County, altitude 607 feet; on the Pennsylvania; the Baltimore and Ohio; and the Chicago, Milwaukee, St. Paul and Pacific railroads; by rail, 62 miles southeast of Indianapolis. The city has a 2,300-acre municipal airport with charter service. Located in a region of farming and stock raising, Seymour is a trade center and has considerable manufacturing interests. Among its industrial products are blankets, shoes and shirts, automotive parts, plastics, farm tools, kitchen cabinets, and veneer. There are food-packing and canning plants, and a farmers' co-operative grain elevator. Educational, cultural, and welfare facilities include public and parochial schools, a business college, a Carnegie library, an art museum, and a memorial hospital. The churches represent the usual variety of denominations. Seymour was founded in 1852, and incorporated as a city in 1867. It was named for a construction engineer of the Ohio and Mississippi Railway, through connection with which, in 1857, the Baltimore and Ohio extended its service westward to St. Louis. The city has mayor and council. Pop. (1940) 8,620; (1950) 9,629.

SFAX, sfäks, city, Tunisia, capital of Sfax district, on the north shore of the Gulf of Gabès, 150 miles south-southeast of Tunis, opposite the Kerkennah Islands. It is strongly fortified and surrounded by gardens and villas. The European, Arab and French portions are the three distinct divisions of the town. The first modern; the second—in the central portion—walled and entered by two gates; the third, a camp. Sfax is an important seaport, with a considerable trade in dates, olive oil, wool, fruits, sponges, and grasses, cotton, woolen and silk goods, superphosphates, soap, perfume and carpets are manufactured. A safe harbor and a railway connecting with the interior are modern features. The harbor is provided with a repair dock and slips for fitting and repairing the sponge and fishing vessels. Sfax was occupied in the 12th century by the Sicilians, and in the 16th century, for a brief period, by the Spaniards. One of the principal events of the conquest of Tunis by the French was the bombardment of the town in 1881. Pop. (1946) 54,637.

SFORZA, sfôr'tsä, a celebrated Italian house, which played an important part in the 15th and 16th centuries, gave six sovereigns to Milan and formed alliances with most of the princely houses of Europe.

The founder of the house was a peasant of Cotignola in Romagna, Giacomuzzo (Muzio) Attendolo: b. Cotignola, in the Romagna, June 10, 1369; d. Jan. 4, 1424, whose skill and courage made him one of the most powerful condottieri of Italy. His surname of Sforza (the forcer), which vouches for his great strength, he is said to have received from Alberigo Barbiano, the true founder of the condottiere mode of warfare in Italy. He served in the wars in the papal states, in Tuscany and in Naples, and died as grand constable of Naples.

His son, Francesco: b. July 25, 1401; d. Milan, March 8, 1466, received the command of the Milanese forces in the war against Venice. In 1447 he laid claim to the states of Milan in virtue of his wife, although she was only the natural daughter of the last duke, and to enforce his claim concluded a treaty with Venice,

and advanced against Milan. He laid siege to the city in 1449, and on March 3, 1450, it was forced by famine to surrender. His son GALEAZZO MARIA: b. Jan. 24, 1444; d. Dec. 26, 1476, a barbarian and a voluptuary, was murdered by conspirators. The son of Galeazzo, GIOVANNI GALEAZZO: b. 1468; d. 1494, never actually ruled. Till 1480 he was subject to the guardianship of his mother and her minister, Checco Simonetta. The latter was then beheaded by his uncle Lodovico, surnamed the Moor, in 1481. Lodovico then assumed the government himself and kept his nephew virtually a prisoner in the castle of Pavia. At a subsequent period he joined the league against France, and was on that account deposed by Louis XII (1500). He was taken to France where he died. His son MASSIMILIANO: b. 1491; d. 1530, once more drove the French from his territories by the aid of the Swiss, but in consequence of the battle of Marignano was obliged to cede his dominions to Francis I (1515) in consideration of a pension. The remainder of his life was spent in France. Francis was afterward driven from Italy by the Emperor Charles V, who invested FRANCESCO: b. 1492; d. Oct. 24, 1535, brother of Maximilian, with the duchy of Milan in 1522. On the death of Francesco in 1535 Charles V conferred the duchy on his son Philip II, king of Spain.

Consult Ady, C. M., *History of Milan under the Sforza* (New York 1907).

SFORZA, COUNT **Carlo**, Italian statesman: b. Lunigiana, Sept. 25, 1872; d. Rome, Sept. 4, 1952. He was a descendant of the Renaissance Sforza family and leading Italian opponent of fascism from its inception to its overthrow.

Appointed minister to China in 1911, Sforza was recalled in 1915, during the First World War, to assume diplomatic control of Corfu and Albania. After Turkey's surrender in 1918 he represented his country as one of the three Allied high commissioners at Constantinople, returning to Rome in June 1919 as undersecretary of state for foreign affairs in F. S. Nitti's Cabinet. At this time he also became a member of the Senate. A year later he was appointed minister for foreign affairs in the G. Giolitti Cabinet. At the Inter-Allied Conference at Boulogne in June 1920, he stoutly opposed Lloyd George's support of Greek ambitions for the dismemberment of Turkey, as proposed by E. Venizelos (q.v.) at prior conferences. He also opposed the secret accord made by his predecessor Tommaso Tittoni with Venizelos and the English, providing for the division of Albania between Greece and Italy with an Italian mandate over that country and transfer of the Dodecanese Islands from Italy to Greece.

On Nov. 12, 1920, at Rapallo, he successfully negotiated a treaty with Yugoslavia. He also signed anti-Habsburg agreements with Yugoslavia, Czechoslovakia and Rumania, and proposed the frontier partition of Upper Silesia finally adopted by the League of Nations.

In November 1922 he resigned as ambassador to France in protest at Mussolini's assumption of the premiership. Thenceforward, he was one of Mussolini's bitterest critics, refusing many overtures of the Duce to join his party.

After the assassination in June 1924 of Giacomo Matteoti, Mussolini's chief critic in the chamber, Sforza was one of three senators who denounced the government as responsible for the crime.

The suppression of all opposition parties in 1926 forced Sforza into exile. As ardent protagonist for a democratic Italy and lecturer in foreign universities, including many in the United States which conferred honorary degrees upon him, he soon achieved recognition as the leader of the exiled patriots. After Italy's surrender he went to Rome in late 1943 and helped to establish the new government. Twice thereafter he was minister without portfolio and on Feb. 2, 1947 became foreign minister in the coalition Cabinet of A. de Gasperi. Ill health forced his retirement on July 26, 1951.

Among his books in English are *Makers of Modern Europe* (1931); *Pachich and the Union of Yugoslavia* (1939); *The Real Italians* (1941); *Contemporary Italy* (1944).

DRAKE DE KAY.

SGAMBATI, zgäm-bä'tē, **Giovanni**, Italian musician: b. Rome, May 28, 1841; d. Dec. 15, 1914. He studied at Trevi, Umbria, and in 1860 removed to Rome. There he gained the friendship of Liszt, whose teaching and influence were of inestimable benefit to him. He became known as a conductor, composer and pianist, and as an interpreter of German music in Italy. He was professor of pianoforte at the Academy of Saint Cecelia from 1877; and in 1897 he founded the Nuova Societa Musicale Romanà. His pianoforte pieces won wide success and he also composed a requiem mass, three symphonies, several concertos, overtures, and organ pieces.

SGANARELLE, zgä'nä'rĕl', a comic character in ancient comedies, frequently used by Molière, with whose plays he is generally associated. He is introduced by Molière in *Sganarelle, ou le cocu imaginaire* (1660). He appears also in *Don Juan, ou le festin de Pierre* (he is Leporello in the opera *Don Giovanni*); and in *L'Amour du médecin; Le médecin malgré lui; Le mariage forcé*, and others. The character as handled by Molière is the source of many popular proverbs.

SGRAFFITO, z'-gräf-fē'tō, a term applied to certain methods of mural decoration and of pottery work. In the former, two coats of plaster of contrasting colors are applied and the outer layer is excised so as to expose the color underneath in the required pattern. The effect thus produced resembles, at a distance, that of a colored bas-relief design. In pottery, the term is applied to the process by which a clay of one color is superimposed upon one of a different, and a design produced by cutting the outer coating. This method of decorating earthenware is probably of Italian origin.

SHABAKA, shăb'ă-kă (Gr. SABACON), first king of the 25th (Ethiopian) dynasty, reigning from 712 to 700 B.C. He was a brother of Piankhi (c.741–721 B.C.), the Ethiopian king who, advancing north from his Nubian capital of Napata on the Nile near the 4th Nile Cataract (its site is just south of the present village of Kareima, Sudan), conquered virtually the entire Nile Valley, including Memphis and most of the delta cities. Piankhi thus became the real ruler of the 23d (Tanite) dynasty and initiated a 60-year period of Ethiopian sovereignty over Egypt.

Shabaka, though supreme in Egypt, was of no assistance to the Jews against their mutual enemies, the Assyrians. His successor, Shabataka, who was probably his son, reigned until 688 B.C. Shabaka's nephew Taharka, third king of the 25th dynasty, ruled from 688 to 663 B.C. In 667 he was driven back to Upper Egypt by the Assyrian King Ashurbanipal, but maintained his rule there until his death.

SHABONEE, shăb'nē, Potawatomi Indian chief: b. possibly near the Maumee River in Ohio, c.1775; d. Grundy County, Ill., July 1859. His father, an Ottawa, is said to have been a nephew of Pontiac (q.v.). Shabonee (variant spellings are Shabbona, Shobonier, Shaubena, Chambler, Chambly) married the daughter of a Potawatomi chief, and on the chief's death succeeded him. After a brief stay in a Potawatomi village on the Illinois River near the mouth of the Fox, he removed to a place in the present southern DeKalb County, Ill., which came to be known as Shabbona Grove. About 1807 he came under the influence of Tecumseh (q.v.) and accompanied him in 1810 on a tour of the northern Illinois country, helping him to form his confederation of tribes. However, after the outbreak of the war of 1812, he refused to participate in attacks on the settlers and saved the lives of several white families at the Chicago massacre of August 1812. Yet he fought on Tecumseh's side at the battle of the Thames (1813). After the restoration of peace he remained firm in his allegiance to the United States. During the Black Hawk War in 1832 he again protected the settlers, sending his son and nephew to warn those at Holderman's Grove and the Fox River, while he himself galloped to warn the settlements at Bureau and Indian creeks. Their descendants in 1903 erected a monument to him and in 1906 dedicated a park to his memory. Despoiled of his lands in his old age, he was given a small farm where he died in poverty.

SHABUOTH, a Jewish feast, known also as the Festival of the Weeks; the most joyous of all the ancient Hebrew holidays. It was originally called the Feast of the Barley.

SHACKAMAXON, shăk-ă-măk'sŏn, **Treaty of,** the compact, traditionally called the "Great Treaty," made by William Penn with the Delaware Indians at their village of Shackamaxon (now Kensington, a part of Philadelphia). Soon after his arrival in the province of Pennsylvania in the fall of 1682 Penn entered into negotiations with the Indians, seeking to establish friendly relations with them. After a number of meetings, on June 23, 1683, under a great elm tree at Shackamaxon several engagements were signed by the chiefs and duly witnessed by whites and Indians. They granted to Penn and his heirs large areas of southeastern Pennsylvania. The chief Indian representative was the sachem Tammanen (Tammany). A century later Benjamin West commemorated the treaty in a painting, while Voltaire alluded to it as "the only treaty never sworn to and never broken." Penn himself described the seating arrangements of one of the meetings in a letter of Aug. 16, 1683, to the Free Society of Traders.

SHACKLETON, shăk'l-tŏn, Sir **Ernest Henry,** British explorer: b. Kilkee, Ireland, Feb. 15, 1874; d. at sea, off S. Georgia Island, Jan. 5, 1922. He was educated at Dulwich College, served in the merchant marine and was a lieutenant in the Royal Navy Reserve. He was third lieutenant under R. F. Scott in the National Antarctic Expedition in 1901–1904, and with Scott reached lat. 82° 17′ S., the farthest point south then touched. He was secretary and treasurer of the Royal Scottish Geographical Society in 1903–1906. In 1907–1909 he commanded the British Antarctic Expedition, and succeeded in reaching lat. 88° 23′ S., Jan. 9, 1909, establishing a new record. He also ascended Mount Erebus, 13,120 feet high, and reached the south magnetic pole Jan. 16, 1909, determining its position as lat. 72° 25′ S., long. 154° E. He headed a third expedition in 1914–1916, crossing Antarctica from Coat's Land to McMurdo Sound and making valuable geologic and scientific surveys. He was awarded the special gold medal of the Royal Geographical Society, the King's Polar medal with two bars, and gold medals from the Royal Scottish Geographical Society, as well as from the geographical societies of Denmark, Belgium, France, Antwerp, Italy, America, Paris, and Russia. He was knighted in 1909 and was an officer of the Legion of Honor. He was author of *Heart of the Antarctic* (1909); *Diary of a Troopship; South* (1919).

SHACKLETON, Robert, American writer: b. Wisconsin, Dec. 26, 1860; d. Hyeres, France, Feb. 24, 1923. He studied law in Michigan, was admitted to the Ohio bar, was journalist in New York five years, was in Philadelphia as associate editor of *The Saturday Evening Post* two years.

He published *Toomey & Others* (1900); *Many Waters* (1902); *The Great Adventurer* (1904); *The Quest of the Colonial* (with Elizabeth Shackleton, 1907); *Adventures in Home-Making* (1910); *A Living Without a Boss* (1911); *Unvisited Places of Old Europe* (1913); *The Charm of the Antique* (with Elizabeth Shackleton, 1915); *Four on a Tour in England* (1915); *Life of Russell H. Conwell* (1916); *The Book of Boston* (1916).

SHAD, *Alosa sapidissima,* a member of the herring family, Clupeidae. This fish runs from Labrador to Florida and has been transplanted successfully to the Pacific where it is now found from Alaska to southern California. It is also present, although rare, in the Lake Ontario basin.

River names are often attached to the common name of this fish, that is, Delaware River shad, Hudson River shad, etc., but this does not imply a separate species.

The shad is blue or blue-green on its back and upper sides; silvery below. Above the gill-cover there is a dark spot, and frequently others along the base line of the blue color.

The fish has a single, short, spineless dorsal fin consisting of about 15 rays. The tail is deeply forked. There are some 60 scales in a series running from gill-cover to tail. The ventral edge of the body is sharply compressed. The toothless

Shad, *Alosa sapidissima.*

jaws fit into each other, a peak in the center of the lower slipping into a notch on the upper. The gill-rakers are long; about 55 on the lower branch of the first gill-arch. A silvery patch on the scaleless cheek is deeper than long. Young shad are more slender than the adults.

The shad reaches a weight of 14 pounds and a length of 30 inches. The females run larger than the males, their average is 4 to 5½ pounds; the males average 2½ to 4 pounds.

The food of this fish consists of insects and insect larvae, very small fishes and crustaceans. It is also known to eat minute plant form.

The shad is primarily a marine fish, but goes into fresh water to spawn. This spawning migration starts from the sea up to the rivers when the water temperature reaches between 50 and 60°F. which is the necessary temperature for their spawning. The males reach the spawning grounds first. During spawning the fish pair, swimming together. The eggs are deposited in shallow water and sink to the bottom. The adults, having spawned, return to the sea. Spawning migration in the north begins toward the end of May; in the south, its peak is in February. A female averages about 28,000 eggs but has been known to contain as many as 156,000. The eggs hatch in about six days. The fry stay in fresh water until colder weather starts them toward the sea, by which time they are between 4 and 5 inches long. They become mature in their third or fourth year.

Because the shad is such a profitable fish commercially, millions of young are hatched artificially and released. There has been considerable depletion of the supply, however, by over-fishing, as it is easy to net them when they are in great schools in the lower reaches of rivers. Pollution has also depleted this population. They are taken in gill or trammel nets. The fish is eaten fresh and despite its innumerable small bones, is a delicious food fish. Shad roe, so popular in the east, is not so in the west, and most of the large catch taken in the Sacramento-San Joaquin region is shipped to eastern markets.

Shad when in fresh or brackish water on the way to the spawning grounds is a fine game fish. It is usually taken on casting or spinning tackle. The mouth is very delicate.

Two shads are found in Europe, the allis shad, *Clupea aloas*, and the twaite shad, *Clupea finte*. The former is not numerous and is found in the Shannon River in Eire, and the Severn and several other rivers of the west coast of England. It is also found in the Rhine as far up as Basle, Switzerland, and in the Elbe in Germany. In France it goes very far up the Seine and the Loire rivers.

The twaite shad is distinguishable from the allis by dark spots on the body above the midline and less numerous and shorter gill-rakers. It spawns later in the season than the allis, and only at night. It is known to be land-locked in lakes of Switzerland and northern Italy, particularly in Como and Garda. This shad is also found in the rivers of the British Isles, but is more common in the Mediterranean and Baltic areas, although it has not been reported from Russia.

This is the fish called in Germany the *maifish* because of its May spawning season.

SHADBUSH. See AMELANCHIER.

SHADDOCK, a small tree (*Citrus decumana*) of the order Rutaceae. It is a native of the Malay Archipelago, whence it has been introduced into India, the West Indies, Florida, California and other warm climates for its fruits. It is a small tree about 25 feet tall, with large ovate leaves, large white flowers and light yellow or pink fruits, with sweet or acid pale yellow or reddish pulp, arranged in sections like those of the orange. In some horticultural varieties the fruits are more than six inches in diameter, and weigh more than 10 pounds. The true shaddocks are pear-shaped and are seldom found in the northern markets, since the round fruited kinds or "pomelos" are in America considered more valuable for shipping. The name "grape-fruit" is often applied to the shaddock because it is produced in clusters somewhat resembling grapes. Other popular names are forbidden fruit, fruit of paradise, pumelo, pompelos and variations of spelling. The tree is somewhat larger than its relative, the orange, and is planted about 30 feet apart. It is found to be most satisfactory when budded upon its own stock, or that of the sour or sweet orange, the first being preferred by many growers. It is considered more tender than the orange and in the United States is grown only in the lower part of the Florida Peninsula and warmer California. The cultivation, fertilization and management are practically the same with the above exceptions to those of the orange and lemon (qq.v.).

SHADES OF DEATH, a name given in maps printed prior to 1788 to the densely forested northern part of the Great Swamp in Luzerne County, Pa., about 12 miles from Wilkes-Barre. Some of the fugitives from the Wyoming massacre of July 3-6, 1778 found refuge here.

SHADOOF, shä-dōōf′, an ancient Egyptian contrivance for raising water. It is extensively in use in the East for drawing water for irrigation purposes, and its prototype is found in use in the South in the United States, where it is employed to draw water from the open "surface" wells. The machine consists of a cross-bar on two uprights; suspended on this horizontal bar is a long rod or branch of a tree, so fixed as to work as on a fulcrum, the long end or lever pointing upward and over the water, usually a river or stream, and the short end behind the bar and nearest the ground. On the short end is affixed a weight of rock or dried mud, to act as a counterpoise to the long end. From the end of the long portion a bucket is suspended. When not in use the shadoof naturally rests with the short weighted end next to the ground and the long end, with dependent bucket, in the air. When it is desired to draw water the bucket is pulled down (by a rope attached to the long end) and is dipped under the water; on account of the weight at

the other end it is now easy to tip the shadoof, again bringing the bucket into the air where it can be poured into any object on the bank desired — often a hole, from which a runnel conveys the water to irrigation ditches. Shadoofs are often made two or more, side by side, or a succession of them along the bank to be used at different stages of the water.

SHADOW, the darkness caused by the interposition of an opaque substance between a luminous point or body and the place upon which the shadow is thrown. When the substance that casts the shadow is in open space, the form of the shadow is that of a section of the substance made at right angles to the direction of the ray of light. When the body casting the shadow is larger than that which emits the light the shadow goes on constantly increasing in diameter the further it goes; when it is of the same size with the latter, the shadow is unlimited in length, but always remains of the same diameter; and when it is smaller the shadow gradually diminishes to a point, where it terminates. The intensity of the shadow depends upon the degree of transparency, translucency or opaqueness possessed by the substance interposed between the point of light and the place on which a shadow is cast.

SHADOW PLAY, or **SHADOW PANTOMIME,** a theatrical performance acted by puppets or persons, whose shadows are thrown upon a screen by means of a light placed back of the performers. The idea is of great antiquity and is thought to have originated in China. It has long been a favored entertainment in Japan, the Malay Archipelago, throughout southern and western Asia, Egypt and eastern Europe. It was introduced in France in the 18th century, and like the puppet shows and pantomimes, became popular as an entertainment for children. It is revived from time to time, usually in vaudeville or cabaret acts.

SHADWELL, Arthur, English physician: b. 21 Sept. 1854; d. 21 March 1936. He graduated at Keble College, Oxford, and after studying medicine practised from 1883 to 1887 at Brighton. In 1889 he abandoned medicine for travel and investigation. He visited the countries of Europe and Canada and the United States, studying their economic, social and industrial conditions, and contributed articles on these subjects to many magazines and newspapers. His books include: 'The London Water Supply' (1899); 'Drink, Temperance and Legislation' (1902); 'Industrial Efficiency' (1906); 'Drink in 1914–1922' (1923); 'The Socialist Movement'; 'Typhoeus or The Future of Socialism' (1929).

SHADWELL, Thomas, English dramatist and poet laureate: b. Stanton Hall, Norfolk, about 1640; d. London, 19 Nov. 1692. He was educated at Cambridge and subsequently studied law. His comedy, 'The Sullen Lovers' (1668), was successful and he thereafter devoted himself to literature. He wrote 17 plays, the most of them modeled on the style of Ben Jonson, which caricatured with genuine humor, though somewhat coarsely, various eccentricities in the manners of the day. After the Revolution he became, in 1688, poet laureate and royal historiographer, succeeding Dryden and thereby incurring the enmity of that poet, who made him the hero of his clever satire, 'MacFlecknoe.' His death was supposed to be due to an overdose of opium. His poetry was of little merit, but his dramatic pieces, though of only temporary reputation, were much lauded in their day. They include 'The Virtuoso' (1676); 'Lancashire Witches' (1682); 'Volunteers, or the Stock-jobbers' (1693), etc. His collected 'Works' were published in four volumes (1720). Consult Gray, W. F., 'Poets Laureate of England: Their History and their Odes' (London 1914), and Ward, A. W., 'History of English Dramatic Literature (3 vols., New York 1899).

SHAEF. See Supreme Headquarters, Allied Expeditionary Force.

SHAFFNER, Taliaferro Preston, American inventor: b. Smithfield, Va., 1818; d. Troy, N.Y., 11 Dec. 1881. He studied law and was admitted to the bar, but practiced little, his attention being largely absorbed by inventions, including the use of high explosives in blasting. In the early days of the telegraph he was an associate of Samuel F. B. Morse. He built the line from Louisville, Ky., to New Orleans and that from Saint Louis to Jefferson City in 1851, and held office in various telegraph companies. During the Dano-Prussian War of 1861 he was in the service of Denmark. He published the *Telegraph Companion: devoted to the Science and Art of the Morse American Telegraph* (1855); *The Telegraph Manual* (1859); *The Secession War in America* (1862); *History of America* (1863); *Odd Fellowship* (1875).

SHAFROTH, shăf'rŏth, **John Franklin,** American lawyer, governor and senator: b. Fayette, Mo., 9 June 1854; d. Denver, Colo., 20 Feb. 1922. He was graduated at the University of Michigan in 1875 and was admitted to the bar in 1876. He engaged in practice in Fayette until 1879, then removed to Denver, Colo., where he practised. He served in Congress in 1895–1905, was governor of Colorado in 1909–1913, and in 1913–19 was United States senator.

SHAFTER, shăf'tẽr, **William Rufus,** American military officer: b. Galesburg, Mich., 16 Oct. 1835; d. near Bakersfield, Cal., 12 Nov. 1906. At first a farmer, on the outbreak of the Civil War he entered the Seventh Michigan Infantry. He participated in the battles of Fair Oaks, Savage Station, Glendale and Malvern Hill; was appointed major 5 Sept. 1862; was taken prisoner at Thompson's Station, Tenn., in March 1863 and exchanged in May of the same year; was made lieutenant-colonel 5 June 1863 and became colonel of the 17th United States colored troops 19 April 1864; brevet brigadier-general of volunteers for gallant and meritorious services during the war; and was mustered out of the volunteer service 2 Nov. 1865. He entered the regular army and became lieutenant-colonel of the 41st Infantry 26 Jan. 1867; assigned to the 24th Infantry 14 April 1869; colonel of First Infantry 4 March 1879; and brigadier-general 3 May 1897. On the breaking out of the Spanish-American War he was given command of the army mobilized for the invasion of Cuba; his first decisive move was the landing of 16,000 men at Daiquiri, Cuba, on 21 June 1898, in about 12 hours without an accident. He conducted the military operations resulting in the surrender of Santiago de Cuba.

After the war he commanded the department of California and Columbia, 1899–1901. Retired June 3, 1901. Consult, Sargent, H. H., *The Campaign of Santiago de Cuba* (3 vols., 1907).

SHAFTESBURY, shäfts'bŭ-rĭ, **Anthony Ashley Cooper,** 1st EARL OF, English statesman: b. Wimborne Saint Giles, Dorsetshire, 22 July 1621; d. Amsterdam, 21 Jan. 1683. He entered Exeter College, Oxford, whence he removed to Lincoln's Inn, with a view to the study of law; but was chosen representative for Tewkesbury in 1640. At the commencement of the civil war he sided with the king's party, though he appeared to deem mutual concession necessary. Finding himself in consequence of this opinion distrusted by the court he went over to the Parliament, from which he received the command of the parliamentary forces in Dorsetshire. When Cromwell turned out the Long Parliament, Sir Anthony was one of the members of the convention which succeeded. He was, nevertheless, a subscriber to the protestation which charged the Protector with arbitrary government, though this fact did not prevent him from becoming one of his privy council. After the deposition of Richard Cromwell he was privately engaged in a plan for the restoration of Charles II, which he subsequently aided with all his influence. He was one of the 12 members of the convention of 1660 who carried the invitation to the king, and was soon after made a privy councilor and a commissioner for the trial of the regicides. In 1661 he was raised to the peerage by the title of Baron Ashley, and appointed chancellor of the exchequer and a lord of the treasury. Yet he gave his strenuous opposition to two of the leading measures favored by the Crown, the Corporation Act in 1661 and the Act of Uniformity in 1662. Afterward his conduct changed and he was one of the members of the obnoxious Cabal (q.v.). He supported the Dutch war and issued illegal writs for the election of members of Parliament during a recess, and in 1673 supported the Test Act. In 1672 he was created Earl of Shaftesbury and Lord High Chancellor. His conduct on the bench was able and impartial. He had not, however, been a whole year in office when the seals were taken from him, probably through the influence of the Duke of York; and from that moment he became one of the most powerful leaders of the opposition. He made use of the Popish plot to force out the Earl of Danby's administration (1678) and produce the formation of a new one, in which he was himself made president of the council April 1679. Amid many violent party proceedings which followed the Habeas Corpus Act was passed. He remained in the administration only until October. In his hostility to the Duke of York, Shaftesbury is now supposed to have entered into connection with the Duke of Monmouth, with the view of supporting his claims to the Crown, a circumstance which gave rise to Dryden's satire of 'Absalom and Achitophel.' In consequence of this suspected design Shaftesbury was once more committed to the Tower and tried for high treason; but the grand jury before whom the bill of indictment was laid ignored it. Not long after this acquittal the earl withdrew to Holland, where he died. He was highly accomplished and easily the greatest politician and governor of parties in his time in England. Consult the biographies by W. D. Christie (London 1871) and H. D. Traill (ib. 1886); also Macaulay's 'History' (1848–55).

SHAFTESBURY, Anthony Ashley Cooper, 3d EARL OF, English moral philosopher: b. London, 26 Feb. 1671; d. Naples, 15 Feb. 1713. He was grandson of the preceding. After travel in Germany, France and Italy, he became (1695) the representative in Parliament of Poole, in Dorsetshire, and distinguished himself while in Parliament by his support of measures favorable to public liberty. In 1698 he gave up his seat, and visiting Holland in the assumed character of a student of physic, he prosecuted his studies, and became intimately acquainted with Bayle, Le Clerc and other literary men. In 1709 he published an 'Essay on the Freedom of Wit and Humor,' an 'Inquiry Concerning Virtue or Merit,' and 'The Moralist, a Philosophical Rhapsody,' being an eloquent defense of the doctrine of a Deity and providence. His 'Sensus Communis,' and his 'Soliloquy, or Advice to an Author,' followed in 1710. At the time of his death he was engaged in a work on the 'Arts of Design.' His works were collected and published together, under the title of 'Characteristics of Men, Manners, Opinions, and Times' (1711; rev. ed. 1714). A new edition by Hatch began to appear in 1870, but was never finished. As a writer he is remarkable for the elegance but also for the excessive artificiality of his style. In all his works Lord Shaftesbury appears a zealous advocate for liberty, and a firm believer in the fundamental doctrines of natural religion; but, although he professed a respect for Christianity, he was doubtless sceptical in regard to revelation. (See CHARACTERISTICS). Consult the works by Spicker (1872); von Gizycki (1876); Fowler, 'Shaftesbury and Hutcheson' (1882); also Rand, 'Unpublished Letters and Philosophical Regimen of the 3d Earl of Shaftesbury' (1900); Leslie Stephen 'Essays on Free Thinking and Plain Speaking' (new ed., New York 1905).

SHAFTESBURY, Anthony Ashley Cooper, 7th EARL OF, English philanthropist: b. London, 28 April 1801; d. Folkestone, Kent, 1 Oct. 1885. He was educated at Harrow and Oxford, and sat in the House of Commons during most of the period from 1826 to 1851, as member successively for Woodstock, Dorchester, Dorsetshire and Bath, but in the latter year succeeded to the peerage. He supported the administrations of Liverpool and Canning, and in 1828 he was appointed a commissioner of the board of control. Six years later he became a lord of the admiralty under Sir Robert Peel. From 1828, when he was appointed a member of a committee of inquiry into the treatment of lunatics, he constantly strove to improve the lunacy laws and administration; and it is largely due to his efforts that most of the worst abuses were removed. But his name must ever be chiefly associated with his noble and successful efforts to improve the condition of factory workers. About 1833 he first proposed the limitation of their working-day to 10 hours, and in spite of opposition his proposal became law in 1847. In 1842 an act was passed under

his direction for the improvement of the condition of colliery workers.

Though a Conservative, he supported the repeal of the corn laws. For 39 years he acted as chairman of the Ragged School Union, and he was also identified with various movements for securing better house accommodation for the working classes. He was president of the Bible Society, of the Pastoral Aid Society, of the Protestant Alliance and of other religious organizations. He was very popular with the masses of the population. He was an ardent evangelical in religious matters, and opposed to rationalistic beliefs and ritualistic practices. He published a volume of *Speeches* (1868).

Consult Hodder, Edwin, *Life and Work of the Earl of Shaftesbury*, 3 vols. (London 1886); Walpole, Sir Spencer, *Studies in Biography* (New York 1907).

SHAG, a cormorant, especially the *Phalacrocorax carbo*.

SHAGREEN, a kind of grained leather, of a close and solid substance, used for forming covers for cases, etc., which easily receives different colors. It is prepared in the East from the skins of wild asses, horses and camels. The most common color is sea-green (given by means of copper-filings and a solution of sal-ammoniac); but blue, red, black and other colors are also given it. Shagreen is also made of the skins of the sea-otter, seal, and shark.

SHAH, shä, the title given by western writers to the sovereign of Iran; in his own country he is known by the compound title Padishah. It is also used in other countries of central and southern Asia, and signifies a sovereign prince or king.

SHAH ALAM, shä' ä-lâm, Mogul emperor: b. June 15, 1728; d. Nov. 10, 1806. He was the last of the Mogul emperors to exercise even a nominal independence and ascended the throne in 1759. For 12 years he was exiled and he finally, in the endeavor to strengthen his authority over his empire, sought British friendship and granted to them Bengal, Bihar, and Orissa in exchange for the city and district of Allahabad. He put himself under the power of the Mahrattas in 1771, but in 1788 Delhi was seized by the Mohammedan rebel, Ghulam Kadir, who put out the emperor's eyes. From 1803–1806, under the protection of Lord Lake, who had defeated the Mahrattas, Shah Alam enjoyed a period of comparative affluence, thus peacefully ending his long and wretched reign.

SHAH JAHAN, shä' jà-hän', also **SHAH JEHAN**, shä' jĕ-hän' (known in his youth as PRINCE KHURRAM), Mogul emperor of Delhi: b. about 1592; d. 1666. He was fifth of the dynasty and in his youth was repeatedly in revolt against his father, Jahangir, upon whose death in 1627 he succeeded to the throne. His reign saw the Mogul empire at the height of its wealth and glory. He destroyed the kingdom of Ahmadnagar in 1636; and while he lost Kandahar to the Persians in 1653, he waged successful war against the Deccan princes in 1655. In 1658, when ill, he was seized by his son, Aurangzeb, and imprisoned the remainder of his life. His reign was distinguished further for its remarkable achievements in architecture. He built the Taj Mahal (q.v.) at Agra as a tomb for his wife, Mumtaz Mahall; the Pearl Mosque at Agra; the palace and Great Mosque at Delhi, which city he founded; and also built the celebrated Peacock Throne, the value of which has been estimated at $30,000,000.

SHAH NAMEH, shä' nä-mé (BOOK OF THE KINGS), is the Persian national epic. Consisting of 60,000 rhymed couplets, it is the life's labor of Firdausi (q.v.), who was born about 935 A.D., died in 1020, and is unquestionably one of the world's great poets. The epic sings the story of the Persian people from their beginnings under Gayāmarth, through the golden age of the half-millennium reign of Jamshīd, down to the conquest of the Sassanids by the Arabs and Islam in the 7th century. It is no accident that in the epic the glorious age of Jamshīd should have been destroyed by the Arab Dahhāk, or Zanāk, who, tempted by Ahriman, became the epitome of evil and tyranny. Written in almost pure Persian, studiously avoiding the Arabic that had come to dominate Persian life and letters, this national epos articulates the long-developing renaissance of the Persian spirit in its reaction to the Arab conquest and lays the foundation of the golden age of Persian literature and thought in the next four centuries following Firdausi. Chanted ritually in the physical culture clubs (the Zūrkhāneh) of a later age of conquest the epic helped keep vigorous the physical and spiritual muscle of the Persian people. Recited in the homes and taught in the schools it has played no small part in the national revival of the 20th century.

The epic does not connect with history until the passages on Zoroaster and Alexander, who is Persianized as the son of Dārā (Darius) and the daughter of the Emperor of Rūm—this latter an example of numerous anachronisms in the poem. Subsequently the epic roughly follows Sassanid history. Of most interest, however, is the earlier portion dealing with legendary kings and heroes who created civilization and made Iran great and powerful. The first king, Gayāmarth, initiated the human saga by subduing the beasts and challenging the demons. He was followed by Hushang who discovered fire and invented the arts of agriculture and metallurgy. Tanmūrath subdued the demons, including their leader Ahriman, from whom he extorted the knowledge of writing. Civilization reached its climax in the great Jamshīd, who, aspiring to divinity, was defeated finally by Ahriman's servant Zahāk. But the latter's intolerable tyranny was challenged by the rebel smith, Kavādh, and overthrown by the invincible and youthful Farīdūn, of the royal race of the Kayān.

After the reign of Farīdūn a time of new troubles arose from his division of the realm among his three sons. Iraj, who received Iran, was murdered by his brothers Salm and Tūr, but avenged by his son Manūchihr, thus beginning the age-old feud between Iran and Turan. Here enter the great Iranian palladins, most famous of whom is Rustam, the Iranian Hercules, not unlike the Germanic hero Siegfried. The last and greatest of his seven mighty exploits is the slaying of the White Div, whose blood restores sight to the blind Shah, Kai Kā'ūs. This hero is best known to English readers from Matthew Arnold's poem, *Sohrab and Rustum*. Sohrāb, champion of Turan, is unwittingly slain by his father Rustam in tragedy which capriciously yet inexorably

moves to its terrible climax. Heroic tragedy is continued in the struggle between Rustam and Isfandiyār, who also has performed his seven great feats of prowess. This struggle also results in the victory of Rustam, but at the predicted price of his own demise soon thereafter. It would appear that this struggle represents a compromise between the rival claims of popular and priestly traditions, with the orthodox hero Isfandiyār receiving his eventual vindication by the prophetic touch of death on Rustam.

Imaginary and legendary rather than factual and historical, anachronistic and often tedious and repetitious, filled with strange conceits and excessive exaggerations, the epic, for all its faults, is a great work of art, characterized by sustained and splendid diction, brilliant imagery and metaphor, vivid and realistic description, melodious yet stately rhythm, fiery phrase and assonant sweetness. Unquestionably it is one of the world's literary masterpieces.

The standard editions of the epic are by Julius Mohl, 6 vols. (Paris 1831–1868), Turner Macan, 4 vols. (Calcutta 1822–1829), J. A. Vullers, and S. Landauer, unfinished, 3 vols. (Leiden 1877–1883). The only complete translation is by I. Pizzi in *Il Libro dei Rei,* 8 vols. (Turin 1886–1888). The best French translation is by Mohl, 7 vols. (Paris 1876–1878). The most extensive rendering into English is that in verse by A. G. and E. Warner, 6 vols. (London 1905–1915); there is an English abridgment by James Atkinson (London 1832, 1886, 1892).

For further details consult T. Noldeke, *Das iranische Nationalepos* (Strasbourg 1896), H. Ethé, *Neupersische Litteratur* (Strasbourg 1896); P. Horn, *Geschichte der persischen Litteratur* (Leipzig 1901); and E. G. Browne, *Literary History of Persia,* Vols. 1 and 2 (Cambridge 1902–09).

SHAHAN, shā'ăn, **Thomas Joseph,** American Roman Catholic educator: b. Manchester, N. H., Sept. 11, 1857; d. March 9, 1932. He was educated at the Montreal College; the American College, Rome; the Roman Seminary, and at the University of Berlin. He was ordained priest in 1882; was chancellor and secretary of the diocese of Hartford in 1883–1888; became professor of church history and patrology at the Catholic University of America in 1891, and from 1909 to 1928 was rector there. He was created domestic prelate of the Pontifical Court, Rome, with rank of monsignor, in 1909, and was consecrated titular bishop of Germanicopolis Nov. 15, 1914. He was a contributor to the leading Roman Catholic magazines; edited the *Catholic University Bulletin* in 1895–1909; and was associate editor of the *Catholic Encyclopedia* in 1905–1929.

He wrote *The Blessed Virgin in the Catacombs* (1892); *The Beginnings of Christianity* (1903); *Saint Patrick in History* (1905).

SHAHAPTIAN INDIANS, shä-hăp'tĭ-ăn, a linguistic stock of North American Indians, the name of which is adopted from the Kootenay name of the Nez Percés, one of its principal tribes. The divisions of the stock occupied a large section of the country along the Columbia and its tributaries in what is now northeastern Oregon, southeastern Washington, and southwestern Idaho, extending from about long. 114° 30′ W. to 121° W., and between lat. 44° N. and 46° N. Their western boundary was the Cascade Mountains; their westernmost bands, the Klikitat on the north, the Tyigh and Warm Springs on the south, enveloping for a short distance the Chinookan territory along the Columbia which extended to the Dalles. Shahaptian tribes extended along the tributaries of the Columbia for a considerable distance, especially along Snake River, their eastern boundary being interrupted by the Bitterroot Mountains. The customs and habits of the tribes composing the stock were fairly homogeneous, the family organization was loose, and the clan system did not prevail. They subsisted chiefly on salmon and on roots and berries, and after the introduction of the horse did more or less hunting. Agriculture was not engaged in, and the villages were of temporary character owing to the necessity of frequently shifting residence in search of food. With the exception of the outbreak of the Nez Percés under Chief Joseph in 1877, due to the failure of the government to fulfill its treaty obligations with the Indians, the Shahaptian tribes were generally peaceful. The principal tribes or bands of the stock, with their present location (1944), are Yakima, 3,001 under Yakima agency, Washington, and perhaps 300 not under an agent; Nez Percé (Chopunnish), 1,500 under Nez Percé agency, Idaho, and 150 under Colville agency, Washington; Klikitat, about 175 under Yakima agency, Washington; Paloos, unknown number under same agency; Tenaino, 70 under Warm Springs agency, Oregon; Tyigh, about 430 under same agency; Umatilla, 123 under Umatilla agency, Oregon; Wallawalla, 624 under same agency; Tukspush or John Day Indians, about 60 under Warm Springs agency.

SHAHJAHANPUR, shä-jä-hän'po͝or, city, India, in central Uttar Pradesh, 100 miles northwest of Lucknow. Its chief industries are agriculture, sugar refining, and distilling. The export trade consists of sugar, pulses, and cereals. The town was founded in 1647 by the Mogul emperor Shah Jahan whose name it bears. Its most interesting architectural features are several fine mosques and the ruins of an ancient castle. In the mutiny of 1857–1858, it was one of the active seats of the rebellion. Pop. (1941) 110,163.

SHAIRP, shârp; shärp, **John Campbell,** Scottish poet and miscellaneous writer: b. Houston, West Lothian, July 30, 1819; d. Ormasary, Argyllshire, Scot., Sept. 18, 1885. He was educated at Glasgow University and Balliol College, Oxford, and after a term as assistant master at Rugby, he was appointed assistant professor of Latin at St. Andrews in 1857, and professor in 1861. In 1868, he was made principal, and thereafter was generally known as Principal Shairp.

From 1877, he also held the chair of poetry at Oxford. As a critic and expositor Shairp was markedly illuminating and careful. His works include *Kilmahoe and High Pastoral and Other Poems* (1864); *Studies in Poetry and Philosophy,* including essays on Wordsworth, Coleridge and Keble, which furnish some of the best of his writings (1868; 4th ed., 1886); *Culture and Religion* (1870); *Life and Letters of J. D. Forbes* (1873), *Poetic Interpretation of Nature* (1877); *Burns* (1879); *Aspects of Poetry* (1881). Posthumous collections are *Sketches in History and Poetry* (1887) edited by W. Veitch; and *Glen Desseray and other Poems* (1888), edited by Palgrave.

Consult Knight, W. A., *Principal Shairp and his Friends* (London 1888); and the article by Dean Boyle in the *Guardian* for Sept. 30, 1885.

SHAKER HEIGHTS, residential city, Ohio, altitude about 1,000 feet above sea level, about eight miles from the city of Cleveland, on federal and state highways. There is also an electric railroad which connects Shaker Heights with downtown Cleveland. There are no industries but there are a number of retail businesses which serve the city.

History.—About 1820 a society of Shakers established a colony within the limits of the present Shaker Heights. The property of this colony was owned in common and the members had community interest in it. The membership eventually declined until the colony disbanded in 1889 and sold its property, consisting of about 1,367 acres, to a Buffalo syndicate. The property was acquired from this syndicate by O. P. and M. J. Van Sweringen, who proceeded to develop it as a residential community. Other lands were acquired by the Van Sweringen brothers, and the community developed almost entirely under their control. The municipality was incorporated as a village in 1912, and became a city in 1931. The form of government is a mayor and council. Pop. (1950) 28,222.

SHAKERS, the common name of the United Society of True Believers in Christ's Second Appearing. Although originating in England the sect is wholly American, and presents in its several communities an interesting example of thrift, industry and good morals.

The founder of the Shaker sect was Ann Lee, born at Manchester, England, in 1736. Her father was a blacksmith, and she became at an early age the wife of a blacksmith. She was converted in 1758 by the preaching of Jane Wardlaw, a member of the Society of Friends, who exhorted the people to repent of their sins, declaring that the end of all things was at hand, that Christ was about to reign, and that his second appearance would be in a woman's form. Ann Lee also preached, and was put in prison at Manchester on a charge of disturbing the public peace. When released she began preaching again, and announced that the Lord Jesus had stood before her in prison, and had become one with her in form and spirit. She called herself "Ann the Word," but her followers gave her the title of "Mother Ann." She was persecuted and annoyed to such a degree that she emigrated to America with seven companions, and formed the first Shaker settlement at Watervliet, near Albany, N. Y. Here she also endured imprisonment with some of her followers who refused to bear arms in the War of Independence, on the ground that it was against their principles to serve as soldiers. Ann Lee died Sept. 8, 1784, having witnessed the founding of two new Shaker communities, one at Hancock, the other on Mount Lebanon, New Lebanon, N. Y., the first Shaker meeting house being established in the year following her death, at Mount Lebanon, which is still the most flourishing of the Shaker communities.

Joseph Meacham, one of Ann Lee's successors, gave to the Shakers their effective organization, which combines thorough business methods with strict adherence to the principles of their faith. There is no marriage, the two sexes occupying rooms in separate parts of houses, and when married couples join the society, they regard each other as brothers and sisters only. The men do the work of farm and garden, factory and shop, and some widely extended industries owe their origin to the inventive ability of the Shakers. The women cook and attend to the housework, every room being a model of cleanliness. They do much of the tailoring and repairing; prepare seeds and medicines for market, and make butter and cheese. Everybody is occupied.

Alcoholic liquors are known only as a medicine, and good health is so general that there is but little need for medicine of any kind. The use of tobacco is tabooed, and the diet, while both generous and varied, does not include flesh-meat or fish. The fact that Shakers live, as a rule, to an advanced age, and enjoy excellent health, is adduced in favor of abstinence from meat. It is also noted as significant that none of the Shakers suffer from cancer.

The Shaker belief agrees in certain respects with that of the Quakers, from whom the original Shakers were an offshoot. They give due respect to the civil law, but they reject ecclesiastical supremacy and military service. Members of the sect who had previously served as soldiers have refused to accept pensions after joining the Shaker community, and it was largely, if not chiefly on evidence of this fact that President Lincoln ordered the release of Shakers who had been imprisoned for refusing to serve, when drafted for the Civil War. The sum saved to the government in the refusal to accept pensions would have more than paid for substitutes for the Shakers who had been drafted.

The Shakers believe that God is king; that the sin of Adam is atoned, and that man is free of all errors except his own; that every human being will be saved, and that the earth is heaven, now soiled and stained, but ready to be brightened by love and labor. They believe in the immediate revelations of the Holy Ghost, and they regard angels and other spirits as maintaining companionship and intercourse with those who have been purified and exalted by the gifts of grace. Shakers believe that at death they merely throw off the bodily garment, and change the form of their existence, but no more. They expect no resurrection of the body, the spirit, when it has left the mortal frame, being done with it.

SHAKESPEARE, William, English poet and dramatist: b. Stratford-on-Avon, Warwickshire; baptized there April 26, 1564; d. there April 23, 1616. His father, John Shakespeare, first appears in the town records in 1552, when he was fined for not removing a dunghill from before his door in Henley Street. He became prominent in town affairs: he was elected a chamberlain of the borough in 1561, alderman in 1565, and high bailiff (mayor) in 1568. He signed documents with a mark, but this is no longer supposed to prove that he was illiterate. From 1577 on to his death in 1601 there are many signs in the records of financial troubles; he is excused from a levy for the poor; he sells his wife's inheritance and he does not attend meetings of the Corporation, so that another is appointed alderman in his place.

Finally, in 1592 he is included in a list of nine who do not obey the law by going to church once a month, a note in the record signifying that this is for fear of process for debt. In 1596, however, he is described by the herald who made a rough draft of a coat of arms for him as a man who «hath lands and tenements of good wealth and substance, 500 li.»

The poet's mother was Mary, daughter of Robert Arden of Wilmcote, a wealthy landowner and relative of the aristocratic Ardens of Park Hall. Eight children were born to her, of whom William was the third child and oldest son. She died in Stratford in 1608.

Early Years.—No records exist of Shakespeare in his early years; something is known, however, about the Stratford Grammar School, which he presumably attended. The curriculum of such a school would have been adequate to provide the poet with the basis for such classical learning as he had—perhaps more than Ben Jonson's «small Latin and less Greek» would suggest, and rather less than some modern commentators suppose.

The two principal legends about his life in the country are that he was apprenticed to a butcher, for whom «when he killed a calf, he would do it in high style, and make a speech,» and that he fled Stratford because he was caught deer-poaching in the park of Sir Thomas Lucy of Charlecote. These stories cannot now be traced back farther than the late 17th century, about a hundred years after the events are supposed to have happened.

Marriage.—The first record of William Shakespeare after his christening is a license for marriage, 27 Nov. 1582, in the episcopal register of the diocese of Worcester. The bride's name is given as Anne Whateley of Temple Grafton. The next day a bond of £40 was entered to secure the marriage, without trouble, of Shakespeare and Anne Hathway or Hathaway, of Stratford. The sum was posted by two yeoman friends of the bride's father, Richard Hathway of Shottery, parish of Old Stratford, whose will had been proved in the preceding July. Anne Whateley and Anne Hathway are probably the same person, and since the latter is traceable, the Whateley entry is probably a clerk's mistake. The special license to which these records refer provided for a marriage after only one asking of the banns; the usual three banns would have carried the wedding into a prohibited period on the church calendar and delayed it for about two months. This delay would have been undesirable because Anne was already pregnant; the baptismal register at Stratford records the christening on 26 May 1583 of Susanna, daughter of William Shakespeare. On 2 Feb. 1585, the same register records the christening of twins, Hamnet (a variant of Hamlet) and Judith, apparently named for a Stratford baker, Hamnet Sadler, a beneficiary and witness of the poet's will, and his wife Judith. Shakespeare's wife bore him no other children; she lived until 1623 and the inscription on her grave records the fact that she was then 67 years old, which would make her about eight years older than her husband.

Nothing is known of Shakespeare's life between the christening of the twins and the first record of his appearance in the theater in London as actor and playwright. Seven or eight years, from about 1584 to 1592, are blank so far as the records go. The actor Beeston, whose father was a member of Shakespeare's company, many years later told John Aubrey that Shakespeare had been a schoolmaster in the country. Because of the academic flavor of such early plays as 'The Comedy of Errors' and 'Love's Labour's Lost' (q.v.), this tradition has found favor with modern biographers. There is no record of Anne Shakespeare in London during her husband's stay there, nor is there anything in Stratford until 1597, when Shakespeare, an established man of the theater, bought New Place.

London, 1592.—In September 1592, Robert Greene, the dissipated University wit, died in poverty and misery in London, leaving a pamphlet called 'A Groatsworth of Wit, bought with a million of Repentance.' In an epilogue he warned three of his friends who wrote plays (probably Marlowe, Peele, and Nashe) against the players, who live on the efforts of writers and then neglect them in their hour of need. «Trust them not,» he says, «for there is an upstart crow, beautified with our feathers, that with his *Tiger's heart wrapped in a player's hide,* supposes he is as well able to bombast out a blank verse as the best of you; and being an absolute *Johannes fac totum* is in his own conceit the only Shake-scene in a country.» This evidently refers to a presumptuous actor, not a University man like Greene and his friends, who has dared to write blank verse plays and is versatile enough to be a threat to them. That the jack-of-all-trades is Shakespeare seems clear from the fact that the «Tiger's heart wrapped in a player's hide» is a parody of a line in III 'Henry VI' and from the pun on his name. Later in the year, Henry Chettle, who had seen Greene's pamphlet through the press, apologized in the preface to his own 'Kind-Heart's Dream.' Marlowe and Shakespeare had apparently resented the attacks in Greene's book (Marlowe, though warned against the players and Shakespeare, had been called an atheist and Machiavellian) and Chettle expressed the wish that he had moderated more of Greene's bitterness than he did. «With neither of them that take offense was I acquainted, and with one of them I care not if I never be. The other, whom at that time I did not so much spare, as since I wish I had, . . . I am as sorry as if the original fault had been my fault, because myself have seen his demeanour no less civil than he excellent in the quality he professes [profession he follows, i.e. acting]. Besides, divers of worship have reported his uprightness of dealing, which argues his honesty, and his facetious grace in writing, that approves his art.»

By the end of 1592, then, Shakespeare had become an actor, written plays, attracted the jealousy of a University-trained poet and hack writer and won the respect of Chettle and «divers of worship» for his civility, his honesty, and his excellence as player and writer. Why he left Stratford, and his wife and children, for London, and how he got a start in the theater, nobody knows. The well-known legend that he began by holding gentlemen's horses at the playhouse door comes down from Sir William Davenant, the wild and eccentric 17th century poet, playwright, and theater manager who sometimes claimed to be Shakespeare's bastard son. There are other legends that he was first a

«servant» in the theater, and that he was first a prompter's assistant or call boy.

Early Poems.—From 1592 to 1594 the theatrical companies were somewhat disorganized because of the plague, and it is during these years that Shakespeare presented himself as a poet. His 'Venus and Adonis' was entered for publication 18 April 1593 by the printer Richard Field, a fellow townsman of Shakespeare's, three years his senior, who had come up to London in 1579. The poem was dedicated to the young Earl of Southampton, a favorite patron of writers of amatory verse, and some sort of monetary acknowledgment was probably given by the nobleman, although the old legend that once he gave the poet £1,000 is incredible. The dedication refers to 'Venus and Adonis' as «the first heir of my invention» [*i.e.*, his first published work] and Shakespeare promises «some graver labor» if this one is found acceptable. The promise was kept a year later, by the dedication of 'The Rape of Lucrece,' in which the poet says he has warrant of the earl's disposition which makes this second offering assured of acceptance. «What I have done is yours,» he says, «what I have to do is yours, being part in all I have, devoted yours»—lines which seem to most readers to suggest an intimacy greater than that reflected in the first dedication.

Actor and Playwright.—Sometime in 1594 were formed the two principal acting companies of the later Elizabethan era, the Lord Chamberlain's men and the Lord Admiral's men. Technically personal servants of these officials, the actors could wear livery, thereby securing protection against prosecution under the old statutes which classified players with rogues and vagabonds. They received also some prestige as retainers of the court, since the puritanical authorities of the City of London looked on players and theaters with disfavor. Furthermore, the patron's license was a useful introduction to the local authorities when the companies toured in the provinces. When they were at home, the players earned their living by producing plays in a public playhouse; occasional performances at court, usually in the holidays, carried prestige but did not provide a major share of their income. In March 1595, the Treasurer of the Royal Chamber notes payment of £20 to William Kemp, William Shakespeare, and Richard Burbage, servants to the Lord Chamberlain, for the presentation at court in Greenwich of two «comedies or interludes» during the previous Christmas holidays. Shakespeare was then a leading member of the company and a «sharer,» or stockholder who participated in the profits. It was a position of some dignity and of considerable promise financially. The Chamberlain's men were to be the favorite court entertainers, giving 32 performances at court during Elizabeth's reign and becoming the King's men upon the accession of James I.

Shakespeare's position in the company, his financial obligations and returns, may be inferred from various legal documents from suits against members of the company in 1610, 1615, and 1619. The company consisted of actor-sharers (of which Shakespeare must have been one in 1594–95), hired men, and boys who played female parts and were assigned to the sharers on something like an apprenticeship basis. With the acquisition of theater property, the Globe in 1599 and the Blackfriars in 1608, some members of the company became investors in real estate—landlords or «housekeepers.» As originally leased, the Globe Theater was held in two moieties or halves, one by Richard and Cuthbert Burbage, and the other by Shakespeare, Augustine Phillips, Thomas Pope, John Hemings and William Kemp. Shakespeare's interest was therefore a tenth, but it varied as members dropped out or new ones were added. He held one-seventh interest in the Blackfriars after it was acquired by the company. He was still holding his share of the Globe when the theater burned in 1613, but whether he retained his interests to the end of his life is uncertain. The most recent and careful estimates of Shakespeare's income from theatrical sources give him about £50 annually to 1599, about £110 to 1608, and after retirement, about £60 to £70 from his interest as «housekeeper.» His income from the theater almost certainly never went over £175 or £200 at the most. Prices were generally so much lower in Shakespeare's time than now that this should be considered a very comfortable income. Shakespeare bought the second largest house in Stratford, for example, for £60, though it should be added that it was then in need of repair.

Shakespeare's first obligation to the company was as an actor; he is listed among the principal actors of Jonson's 'Every Man in his Humour' in 1598 and 'Sejanus' in 1603, but he does not appear in the lists after that date. The First Folio edition of his own plays, 1623, lists him among the actors but does not specify the plays in which he took part. Legend has assigned to him the minor roles of Adam in 'As You Like It' and the ghost in 'Hamlet.' But his chief contribution to the company was, of course, the plays. He provided, alone or in collaboration, 38 plays between 1590–91 and 1612–13, and his work constitutes the most substantial part of the company's repertory for the period. His relations with his fellows seem to have been very cordial; he received a small bequest in the will of Augustine Phillips, and he left money in his own will for memorial rings to Burbage, Hemings, and Condell. The devotion of the two latter actors to his memory is obvious from the prefatory matter to the First Folio, which they edited.

Biographical Records.—Some details of his personal life during his first decade in London have come down to us. His son Hamnet was buried 11 Aug. 1596 in Stratford. About the same time John Shakespeare, the poet's father, applied to the College of Heralds for a grant of arms, and a rough draft, drawn up by a herald, is dated 20 Oct. 1596. A note to a revised draft says that John Shakespeare possessed a pattern of the arms drawn up 20 years earlier, so this was apparently not the first time the poet's father had sought the insignia of a gentleman. It is usually suggested that William must have prompted the revival of interest in arms, since his father was not at this time in prosperous circumstances, as he had been 20 years before, whereas the son was now increasing in wealth and dignity. There are contemporary jokes about actors who seek or assume coats of arms, and a manuscript of 1604, or later, mentions Shakespeare's colleagues Phillips and Pope as using arms to which they were not entitled. The Shakespeare request was appar-

The Shakespeare Memorial Theatre at Stratford on Avon.

ently granted, and the now familiar coat with the falcon and spear appears on the poet's monument in Stratford church. Three years later, leave to impale the arms of Arden was asked, but if this was granted, Shakespeare seems not to have made use of it.

In 1597 the records of the tax collectors give us some information about Shakespeare's London address. He is listed as one of the inhabitants of St. Helen's parish, Bishopsgate (a district not far from the Shoreditch theaters, The Theatre and The Curtain) who cannot be found to pay the tax, which for Shakespeare was 5s. The next year he is listed as owing 13s. 4d., and the collectors have traced him to the bishop of Winchester's liberty, the Bankside in Southwark (close to the site where the Globe Theater was to be built). There, presumably, he paid his taxes, for his name does not appear as a delinquent in future rolls.

In 1597 he purchased New Place in Stratford, the house he was to repair, retire to when he left London, and hand on in his family as far as his granddaughter, his last lineal descendant. The prosperity which this transaction suggests is also indicated by a letter from Abraham Sturley of Stratford to Richard Quyney in which Shakespeare is said to be willing to purchase some land in Shottery and by a letter from Quyney to Shakespeare asking the loan of £30. This is the only letter to or from Shakespeare in existence; Quyney's other correspondence suggests that the loan was promptly made. Also in 1598 when an accounting was made of corn and malt in Stratford, in an attempt to check hoarding during a shortage of grain, Shakespeare was credited with 10 quarters, or 80 bushels; only a dozen residents of Stratford had more. In the next year he invested in his share of the Globe Theater. In 1602 he purchased, for the large sum of £320, 107 acres of arable land in Old Stratford. His largest investment, however, was made in 1605; it was the purchase, for £440, of a moiety of certain tithes of three hamlets in Stratford. This produced, in 1611, an income of £60. In 1613 Shakespeare bought a gatehouse in Blackfriars, London, for £140.

Not much is known of Shakespeare's life in London aside from his work, and the few records we do have seem to raise as many questions as they answer. He was involved in two quarrels which got into the courts, but in neither case was he a principal. In 1596 he figured in a writ asking sureties of the peace against William Shakespeare, Francis Langley, Dorothy Soer and Anne Lee, on the part of one William Wayte. Langley, who had built the Swan Theater, had earlier sworn the peace against Wayte and his stepfather, William Gardiner. Shakespeare's part in the quarrel does not seem clear, but somewhat fantastic applications of it to characters in his plays have been offered. In 1612 he was a witness in a suit brought by Stephen Belott, a wigmaker, against his father-in-law, Christopher Mountjoy, over a marriage portion. Shakespeare is shown to have known the French Huguenot Mountjoy family since about 1602, to have lived in their house in Cripplegate for a time in 1604, and to have served, at Mrs. Mountjoy's request, as an intermediary to persuade the apprentice Belott to marry his master's daughter. But his testimony was useless, since he could not remember what marriage portion had been agreed upon eight years earlier. The suit was finally turned over to the elders of the French church in London, who decided for Belott but noted that both father and son-in-law were dissolute characters.

The little evidence we have concerning the habits and behaviour of Shakespeare is somewhat contradictory. The Bankside was not a «respectable» district; the brothels and bear-baiting pits were there, and it was frequented by the sporting element rather than by sober citizens. John Manningham, a law student, entered in his diary on 13 March 1602, a story that Shakespeare overheard Burbage making an assignation with a «citizen» at a performance of 'Richard III.' The actor was to announce himself as Richard the Third; Shakespeare got there first, was entertained, and when Burbage arrived and announced himself, the author sent down word that William the Conqueror was before Richard the Third. Against this gossip is the general statement of John Aubrey, who had it from Beeston, that Shakespeare «was not a company keeper» and «wouldn't be debauched.» From the little we know it must be concluded that he led a much more dignified and quiet life than Marlowe, Greene, Peele or Ben Jonson. The legends of his frequenting the Mermaid Tavern where he had wit combats with Jonson, and of the drinking bout in Stratford with Jonson and Drayton, come down from the 17th century.

Chronology of the Plays.—Shakespeare's plays were divided by the folio editors into comedies, tragedies, and histories. These are not clear-cut categories in fact, but they are useful. His earliest work was in the chronicle history play, the three parts of 'Henry VI' and 'Richard III' dated approximately 1590–92. But he tried comedy on classical models, 'The Comedy of Errors' (1592–93), 'The Taming of the Shrew' (1593–94), 'Two Gentlemen of Verona' and 'Love's Labour's Lost' (1594–95), and tragedy, 'Titus Andronicus' (1593–94) and 'Romeo and Juliet' (1594–95) as well. His comedy grew further in the direction of romantic and idyllic lyricism as he progressed, and intrigue and farce gave way to love as a principal motif. In 'A Midsummer Night's Dream' (1595–96), 'The Merchant of Venice' (1596–97), 'Much Ado about Nothing' (1598–99), 'As You Like It' and 'Twelfth Night' (1599–1600), Shakespeare reached the height of this development in comedy. At the same time he brought his history plays to a culmination in the cycle of the two parts of 'Henry IV' (1597–98) and 'Henry V' (1598–99), where the rich comic scenes of Falstaff and the eloquent patriotism which he had earlier exhibited in 'Richard II' transcend the limits of the form. The middle period of his career is devoted mainly to tragedy, with 'Hamlet' (1600–01), 'Othello' (1604–05) 'King Lear' and 'Macbeth' (1605–06), but including also the so-called «bitter» or problem comedies, 'Troilus and Cressida' (1601–02), 'All's Well that Ends Well' (1602–03), and 'Measure for Measure' (1604–05). The great tragedies are usually held to be the finest performance of European dramatic genius since the Greeks, for profundity of meaning and characterization, as well as for permanent effectiveness in the theater and magnificent beauty of expression. In the last period of his career he turned again to Roman history, which he had already drawn

upon in 'Julius Caesar' (1599–1600), and produced 'Antony and Cleopatra' (1606–07) and 'Coriolanus' (1607–08); but the most characteristic plays of this final period belong to the type called tragicomedies or dramatic romances. They include 'Cymbeline' (1609–10), 'The Winter's Tale' (1610–11), and 'The Tempest' 1611–12). These plays combine the melodramatic plots found in tragedy with the idyllic atmosphere and charming heroines of romantic comedy.

Various attempts have been made to relate the differences between the periods to Shakespeare's own attitude toward life—to say that he wrote tragedy "in the depths" and comedy "on the heights." The temptation to do so is probably irresistible, but it should be borne in mind that he was not a highly "subjective" writer, that he was influenced in his early and late periods by the successes of other men, and that he must have had more interest in the purely artistic problems confronting him than we can very well realize.

That Shakespeare was an artist is obvious: the quality of the plays cannot be the result of accident. But this does not mean that he was writing for readers. He was writing for the stage; he and his company profited mainly from the production, not the publication, of his plays; there is no evidence that he prepared any of his plays for the press. The question, then, of how his plays got from his own manuscript to our modern texts is of importance and interest.

Quartos and Folios.—Eighteen of his plays were published separately as quarto pamphlets; these were reprinted in the folio collection of 1623 and 18 unpublished plays were added. The editors of the folio, Shakespeare's fellows, Hemings and Condell, condemned the earlier quartos as "divers stolen and surreptitious copies, maimed and deformed by the frauds and stealths of injurious impostors"; in the folio, it was claimed, these plays were given "cured and perfect of their limbs" and the unpublished plays "absolute in their numbers as he conceived them." For over two centuries these words were taken literally, but modern research has shown that usually the folio editors reprinted an earlier quarto when there was one; often they used a recent quarto, with its accumulated misprints, rather than the earliest one. But they did often introduce changes, apparently from a playhouse manuscript. Furthermore, some of the quartos show signs of having been set up from Shakespeare's own manuscript or a very faithful copy of it. Prejudice against the quartos is well justified, however, in the case of six, now always called the "bad quartos"; they are the 'Romeo and Juliet' of 1597, the 'Henry V' of 1600, the 'Merry Wives' of 1602, the 'Hamlet' of 1603, and the 1594–95 editions of parts II and III of 'Henry VI.' These badly garbled texts certainly never came from the prompt copy or the author's manuscript. They were either taken down in faulty shorthand by an agent in the audience, or, more probably, constructed from memory by an actor or other employe of the company. Sometimes the version on which the reconstruction was based may have been a shortened form used on tour in the provinces. And there is always the possibility that different texts of a play originated before and after revision by the author or someone else.

Manuscripts.—No author's manuscript of a play in the folio has survived, but in recent years a strong case has been made out for Shakespeare's hand as one of those in a play of composite authorship called 'Sir Thomas More.' Most scholars, but not all, now believe that 147 lines on three pages of manuscript in the British Museum are in Shakespeare's own handwriting. If so, some confirmation has been found for the statement of the folio editors concerning their author's facility: "His mind and hand went together, and what he thought he uttered with that easiness that we have scarce received from him a blot in his papers." Ben Jonson's retort to this remark is characteristic and famous: "I remember, the players have often mentioned it as an honor to Shakespeare that in his writing, whatsoever he penned, he never blotted out line. My answer hath been: Would he had blotted a thousand, which they thought a malevolent speech. I had not told posterity this but for their ignorance, who choose that circumstance to commend their friend by wherein he most faulted, and to justify mine own candor, for I loved the man and do honor his memory (on this side idolatry) as much as any. He was, indeed, honest and of an open and free nature; had an excellent fancy, brave notions, and gentle expressions, wherein he flowed with that facility that sometime it was necessary he should be stopped: *Sufflaminandus erat,* as Augustus said of Haterius. His wit was in his own power; would the rule of it had been so too."

It is not surprising that no manuscripts of Shakespeare plays in the folio have survived; 20th century interest in original manuscripts should not be assumed to have existed in the 16th century. The author's manuscript, moreover, was of practical value as a working text of the play, and it would have been used rather than preserved. Upon completion of a play, the company had first to send it to the official licenser, who was the Master of the Revels. In Shakespeare's time this official was first Edmund Tilney and later Sir George Buck. He read it and affixed his signature to the manuscript (for which he got a fee) if the play seemed to him to be free from offense. The main interest of this censorship was political; 'Sir Thomas More' was not produced, for example, because the master found some of its speeches dangerous and would allow the play to appear only if considerable changes were made. Later, in King James' reign, there was a law against oaths, and the licenser was supposed to see that no profane matter crept in. If the play met with his approval, he signed a warrant on the last page, pocketed his fee, and returned the manuscript to the players. They then either had a transcript made or used the original for a director's copy. Notes of stage directions were made, sometimes with the names of the actors concerned; it is from such a note, carried over into print, that we know Will Kemp played Dogberry in 'Much Ado.' A "plot" or synopsis of scenes, with entrances noted, was drawn up to hang in the tiring room, and the parts for the individual actors to memorize were copied out from the manuscript. The problems of direction in the Elizabethan theater, the difficulties an author had to overcome before his play was produced as he wished, can best be inferred from Hamlet's advice to the players.

There Shakespeare shows a sensitiveness to diction («Speak the speech I pray you as I pronounced it to you, trippingly on the tongue»), a dislike of extravagant over-acting («O, it offends me to the soul to hear a robustious, periwig-pated fellow tear a passion to tatters»), a love of «the modesty of nature» and an annoyance at interpolated gags by a comedian («That's villainous, and shows a most pitiful ambition in the fool that uses it»).

The Elizabethan theater did not have the system of long runs of plays familiar to us. The company kept several plays in repertory during a season, and when the manuscript was no longer needed as a prompt copy, it would be put away until some occasion for revival, a tour in the provinces, or an opportunity to play at court came about. If, for any reason, the players decided to publish a play, the manuscript would have to undergo the vicissitudes of the printing house as well as those of the theater.

Sources—Shakespeare, like all other dramatists, drew not only upon life but upon books for his material. In several instances, notably 'King John,' 'The Taming of the Shrew,' 'Henry IV,' 'King Lear,' and 'Hamlet,' he rewrote old plays. For his English historical plays he turned for material to Raphaël Holinshed's 'Chronicle' (2d ed. 1586). He found there plenty of historical detail, brief and formal characterization, and the prejudices about English history of the 15th century which favored the Tudor interest. He used his material with freedom, taking motives out of their context, altering the ages of characters (e.g., Hotspur)—doing anything, in fact, which would increase the dramatic effectiveness of his play if it did not too seriously contradict general knowledge. History plays were popular in the decade following 1588 because of the renaissance of English patriotism after the Armada, and there are many indications that the Elizabethans considered the plays «true history,» as educational as the chronicles and much more entertaining. In the history play Shakespeare found opportunities for the study of character which served as preliminary exercises for his greatest achievements. Richard II, for instance, is a character who foreshadows Hamlet in part, and Richard III prefigures Iago.

A much richer book from the point of view of character portrayal provided him with the material for his Roman tragedies. This is Sir Thomas North's translation (1579) of Plutarch's 'Lives.' Here Shakespeare got not only complex biographical analyses of the heroes of antiquity, but also much that was useful for style. He versifies whole pages of North's prose; the most remarkable example is Enobarbus' description of Cleopatra's barge ('Antony and Cleopatra' II. ii, 198ff.). But there is still very great freedom in selection and utilization of material, and much that he uses is transformed by passing through the romantic imagination of the Englishman. Enobarbus is almost entirely Shakespeare's invention, and the citizens in 'Julius Caesar' he saw not in a book but on the streets of London.

Twice Shakespeare dramatized English novels: 'As You Like It' from Lodge's 'Rosalynde,' and 'The Winter's Tale' from the 'Pandosto,' of that Robert Greene who years before had called the poet an upstart crow. Many of his plays depend, directly or indirectly, upon Italian tales of love, adventure, and violence. Modern criticism has questioned whether there is always a unity between these adopted plots and the characters who enact them. If the disunity is found, it is only another evidence of the profound way in which character absorbed the playwright's mind, even to the occasional neglect of other matters.

Other great books, such as the English Bible and the 'Essays' of Montaigne, have been shown to have strongly affected Shakespeare's thought and phrase. However «unlearned» he was, books played a large part in his education.

Mind and Opinions.—His mind and opinions are not so inscrutable as the 19th century supposed them. When Matthew Arnold wrote

> Others abide our question. Thou art free.
> We ask and ask: Thou smilest and art still,
> Out-topping knowledge

he was summing up a romantic point of view. But modern investigation and a somewhat more skeptical approach have yielded a credible picture of the man Shakespeare, however elusive the explanation of his genius remains. «He was not of an age, but for all time» wrote Jonson of him, and the statement is true in more than one sense. Shakespeare shows remarkably little interest in purely contemporary aspects of his age. It is surprising to find in all his works no reference to the water-men who plied their boats for hire across the Thames and were a common and colorful feature of everyday London life, especially to one whose place of business was on the Surrey side. And it is even more curious that he never mentions tobacco.

The plays have been combed for references to contemporary events and persons, with meager results. There is a reference to Queen Elizabeth in 'Midsummer Night's Dream,' but Shakespeare does not comment on her death in 1603. There is a reference to Essex in one of the choruses of 'Henry V,' but it expresses a hope which was sadly disappointed. A passage in 'The Merry Wives' glances at some farcical difficulties of Frederick, Count Mömpelgart, in securing horses when he was on a visit to England. Macbeth includes a prophesy intended to flatter King James. There may be other topical references not now recognizable, but even so, Shakespeare, in comparison with his fellows, is remarkably indifferent to the news of the day. Perhaps he shared the disdain of his Rosencrantz, who told how the boys' companies acted topical plays to score a cheap success: «There is, sir, an aery of children, little eyases, that cry out on the top of question, and are most tyranically clapped for 't.»

The poet's sensitiveness was touched, rather, by the Warwickshire countryside, the environment of his youth; its native flowers and trees, the field sports, country people, and animals are always vividly evoked. His fairy lore is that of his native county, and he carries with him, to Belmont in Italy where Lorenzo and Jessica are wooing, to the woods near Athens where Theseus is celebrating his wedding, to the glassy stream in Denmark where Ophelia drowned—the five senses of an English country boy. Milton described him as «Fancy's child, warbling his *native wood-notes* wild.»

Even his political sympathies are conservative; he is most eloquent in praise of degree

and rank ('Troilus and Cressida,' I, iii, 75–137); of the divinity of kingship ('Richard II'); of feudal loyalty and devotion ('Henry V'); and of «little England,» not the great empire envisioned by a Raleigh or a Drake ('Richard II,' II, i, 40–50). He shows constant fondness for the tillers of the soil and distaste for the workmen of the city, whom Dekker and Heywood glorified. In Tucker Brooke's phrase, the penumbra of his mind was archaic.

Recent investigation of Shakespeare's imagery has shown some interesting associations in that part of his mind below the level of consciousness. Sometimes a group of images will dominate a play, giving an emotional aura to it which denies the stark objectivity often attributed to the dramatist. In 'Hamlet' for example the dominant images relate to disease, and in 'Troilus and Cressida' to cooking and food. Persistent themes like fire, music, storms, animals weave themselves through the tragedies, and although the predominance of one of these over the others in any given play may be open to different interpretations, this approach will probably lead to results which distinguish Shakespeare as an individual more sharply than ever before.

Sonnets and Lyrics.—Shakespeare was as much a poet as a playwright. Fortunately, the existence of a poetic drama which, after Marlowe, was capable of the greatest expression poetically and dramatically made it unnecessary for Shakespeare to continue the career as a nondramatic poet which he had begun with 'Venus and Adonis' and 'Lucrece.' The exception to this is his series of sonnets published in 1609. (See SHAKESPEARE'S SONNETS.)

In 1599 a small anthology called 'The Passionate Pilgrim' was issued by the publisher William Jaggard with the name of Shakespeare on the title page. Among the 20 poems are two sonnets by him and three excerpts from 'Love's Labour's Lost,' but some of the other poems are known to be by other men and possibly all of them are. When the book reached a third edition in 1612, several selections from Heywood's 'Troia Britanica' were added, and Heywood protested at the piracy, with the remark that Shakespeare was also vexed. This led to the issuance of a new title page without an author's name. In 1601 a genuine poem by Shakespeare, now always called 'The Phoenix and the Turtle,' appeared in Robert Chester's 'Love's Martyr,' a collection of poems celebrating the love of Sir John Salusbury and his wife. Shakespeare's poem is a «metaphysical» one, in quatrains, and it has met with both strong condemnation and strong praise. Appended to the edition of the sonnets in 1609 was a poem called 'The Lover's Complaint'; modern critics doubt, on internal evidence, that it is by Shakespeare.

Not these miscellanea, but the songs and other lyrical passages in the plays, and the sonnets, give Shakespeare the very highest rank as a lyric poet. When he wrote for music, his style became clear and limpid, however tortured and complex the play might be. The songs are commonly filled with pleasant details of nature, very English, but they never become prosy or pedestrian. They show the gaiety of the contemporary ballet or dancing song, the gravity of the motet, and the occasional epigrammatic quality of the madrigal. All of these part songs had reached the height of their development in the poet's lifetime, and the modern song with accompaniment, the «air,» was just coming in. Two of Shakespeare's songs can still be sung to contemporary musical settings; they are «It was a lover and his lass,» set by Thomas Morley in his 'First Book of Airs' (1600), and «O Mistress Mine,» set by Morley in his 'Consort Lessons' (1599), and by William Byrd with elaborate variations for the virginals. The songs at the end of 'Love's Labour's Lost' beginning «When daisies pied and violets blue» and «When icicles hang by the wall» have been called by Masefield the loveliest thing ever said about England. But most important of all, the songs always have a dramatic purpose and a dramatic effectiveness; the poet never releases his lyricism wantonly or idly.

Rhetoric.—Like all Elizabethans, Shakespeare was fond of conceits, tricks with words and ideas, puns. Dr. Johnson's statement of it is famous: «A quibble was to him the fatal Cleopatra for which he lost the world and was content to lose it.» But Keats saw that the working out of conceits produced in the poet a kind of intensity which threw out many fine things, as if said unintentionally. And in Shakespeare's mature style, what was once extraneous decoration, suited to the taste of readers of Lyly, has become metaphor of the richest sort, and metaphor is of the essence of poetry. No description of Shakespeare's achievement as a poet could better his own, when he added to his passage on the lover and madman as imagiiners, a characterization of the poet:

> The poet's eye, in a fine frenzy rolling,
> Doth glance from heaven to earth, from earth to heaven;
> And, as imagination bodies forth
> The form of things unknown, the poet's pen
> Turns them to shapes, and gives to airy nothing
> A local habitation and a name.

The Elizabethan Stage.—No emphasis on Shakespeare as a poet should carry with it the implication that he was not at home in the theater. His solution of problems which confronted him as a playwright is as great as his success in making poetry. The Elizabethan stage was more plastic than ours; spectators surrounded it on three sides, and the scenic effects, lighting, and framing of our stage by the proscenium arch were all lacking. An outer stage stuck out into the pit, and behind it was a small inner stage, across which a curtain could be drawn. Above the inner stage was a balcony or upper stage. Properties were used, but if they were on the outer stage, no curtain could be used to conceal their removal. The audiences were not provided with programs listing the time and place of each scene, and the notation of time and place in modern editions of the plays is the anachronistic contribution of modern editors. Shakespeare was working, then, within a very different set of conventions from those we are accustomed to in the theater. He indicated the location of a scene only if it was important for the audience to know, and then he had to do it in the lines. The inner stage could be a cave, a study, or a bedroom; it could be all three in succession. The upper stage could be the top of a town wall or Juliet's balcony; the outer stage could be a street or a forest or a throne room. Because there was no scene shifting and because many scenes were unlocalized, the pace of the play

could be very rapid. And this generalization of location made a difficulty for the dramatist in the indication of dramatic time. Shakespeare, as we might expect, made of difficulty an opportunity, so that in 'Othello,' for example, he is able to have two time schemes, contradictory but not noticeably so to the spectator, each of which has its subtle effect upon the feeling and tension of the drama.

The closeness of the audience to the actors made the soliloquy and the aside seem much less artificial than they seem on the less intimate modern stage, and these conventional devices are also means of achieving swiftness and directness, since conveying the same information by dialogue, however «natural» it might seem, would take much longer. But Shakespeare did not rest content with the soliloquy as an economical device: witness 'Hamlet.'

The makeup of an Elizabethan repertory company was another source of limitations and opportunities for the playwright. Actors naturally specialize somewhat in such a company, and their individual peculiarities must be allowed for. Happily, in Richard Burbage, the Chamberlain-King's men had an actor of great versatility and talent for the leading roles, and in Kemp and Armin, Shakespeare seems to have had two extraordinarily good clowns. The most peculiar aspect of the company to modern eyes was the necessity of using boys to play female parts. How could a heroine of any greatness be adequately portrayed by a boy? Shakespeare seized enthusiastically upon the romance device of a girl disguising herself as a boy, and in the comedies where the heroine is most important, Rosalind and Viola project their charm in disguise. Furthermore, his heroines derive their attractiveness not from physical charm, but from wit and modesty, gaiety and purity. Even Cleopatra, the serpent of old Nile, conquers Antony by keen insight, sensitive and brilliant dexterity of mind and temper, rather than by elementary physical appeal.

There is little protest in Shakespeare at the limitations of his medium. Once, in a chorus of 'Henry V,' he asks how «this wooden O,» the Globe Theater, «this unworthy scaffold,» can represent the vast fields of France where Harfleur and Agincourt were won. And Cleopatra imagines «some squeaking Cleopatra boy my greatness» in Caesar's triumph, but this is rather a fear of parody than of representation. In 'As You Like It,' 'Macbeth,' and 'The Tempest' he uses the old idea of the world itself as a bare stage, with the actions of men and women merely the plot of a play, and he apparently felt that it was as futile to complain of the limitations of the theater as it would be to complain of the limitations of life itself.

Last Years, 1613–1616.—Shakespeare retired from active service as the leading playwright of the King's men sometime in 1612 or 1613, leaving his position to the younger John Fletcher, with whom he collaborated in 'Henry VIII' and 'The Two Noble Kinsmen.' The last years of his life have interested his imaginative biographers almost as much as the lost years of his youth, and the picture given usually tells more about the biographer than about the subject. The first biographer, Rowe, said: «The latter part of his life was spent, as all men of good sense will wish theirs may be, in ease, retirement and the conversation of friends.» Sir Sidney Lee and Lytton Strachey fill in other details from fancy. But if we turn to the Stratford records again, we find only that his brother Richard was buried 4 Feb. 1613; he was given £5 in the will of John Combe, a wealthy Stratford moneylender, in 1614; he protected his investment in the tithes against possible harm from the enclosures of Combe; his daughter Judith married the son of his old friend Richard Quyney in February 1616; and he drew up his own will in March 1616 and died on 23 April of that year.

The Will.—The will is extant, and each of its three pages bears Shakespeare's signature. He left £300 to his daughter Judith, part of it as a marriage portion, £20 to his sister Joan and £5 to each of her three sons, £10 to the poor of Stratford, small remembrances to a few friends, his second-best bed to his wife, and the residuary estate to his daughter Susanna, who lived with the Shakespeares at New Place. Presumably Susanna was to see that her mother was taken care of. It is apparent that Shakespeare wished to found a family of landed gentry, for he provides that the estate shall go to the male issue of his daughter Judith if Susanna and her daughter Elizabeth both fail to have a son. Susanna was the wife of Dr. John Hall, a prominent physician who left some manuscript case books, later translated and published, which mention illnesses of his wife, his daughter and himself, but none of his father-in-law. The Halls had no son, and their daughter Elizabeth married first Thomas Nash and later Sir John Bernard, but died childless in 1670, the last direct descendant of the poet.

Shakespeare was buried 25 April 1616. On his gravestone are four lines of doggerel verse:

> Good friend, for Jesus' sake forbear
> To dig the dust enclosed here!
> Blest be the man that spares these stones
> And curst be he that moves my bones.

Seventeenth-century legend says that Shakespeare wrote these lines himself and that the curse effectively prevented opening of the grave, «though his wife and daughter did earnestly desire to be laid in the same grave with him.»

Portraits.—The only two portraits of Shakespeare which have any authority are the bust on his monument in the Stratford church, done by Gheerart Janssen sometime before 1623, and the engraving by Martin Droeshout which serves as a frontispiece to the First Folio. It is not known whether either Janssen or Droeshout had ever seen their subject, but the latter was only 15 when Shakespeare died. Neither portrait can be called a work of art, but presumably the bust was enough of a likeness to satisfy the family. The various paintings, some contemporary with him, which are claimed to be of Shakespeare, serve the purpose of pacifying those who are revolted by the stolid expression of the bust and the engraving. But the safest thing to do is to follow the advice of Ben Jonson and «look not on his picture, but his book.»

Posthumous Reputation.—Shakespeare did not succeed in founding a family; neither was he the founder of a literary school of followers, as Spenser and Jonson were. There is ample evidence from the allusions to him even before 1600 that he was a popular writer, both as poet and as playwright. Jonson, the greatest critic of the age and a man opposed on principle to much

in Shakespeare's kind of art, did him full justice. The references to him between 1590 and 1700 collected in 'The Shakespeare Allusion Book' fill two large volumes, and others have been found since.

In general, his reputation has remained high in succeeding ages. The Restoration period sometimes preferred Jonson for correctness and Beaumont and Fletcher for «the language of gentlemen,» but Shakespeare was popular on the stage and Dryden praised him highly and discriminatingly. In the 18th century a kind of Shakespeare idolatry set in which lasted well into the 19th. This served in part as an attack upon the rigid canons of neoclassic taste and an aid to the growing Romantic Movement, but it should be remembered that Dr. Johnson, certainly no romantic, defended Shakespeare for violating the unities, even if he did regret that poetic justice was not always employed in the conclusions of the plays. The reaction against the idolatry has not lessened his fame or station among the world's great, and it has carried with it a tremendous amount of scholarly study, to which Americans and Germans have contributed as much as Englishmen—study which has thrown revealing light on the theater, the companies, the texts, and the man himself.

Theatrical History.—The greatest actors of the English-speaking stage have uniformly attempted the major Shakespearian roles, and the plays have served for 300 years as the greatest test and greatest opportunity for actor, producer, and designer. After Burbage the next actor of first rank is Thomas Betterton (q.v.). His devotion to Shakespeare led him to make a pilgrimage to Stratford and collect data which he gave to Rowe, the first biographer. He was famous as Hotspur, Brutus, Othello, Macbeth, and Lear; he played Hamlet with great success until he was over seventy. Many of the versions he used were «improved» for Restoration taste, but in his own acting versions he refused to paraphrase the poet.

In the mid-18th century David Garrick (q.v.) dominated the stage, and he served Shakespeare as actor, producer, and adapter. He failed in the parts of Othello and Iago, but his Lear and Hamlet were great successes, and his comic talent was shown in his Benedick.

Garrick's successor in the great tradition was John Philip Kemble (q.v.) who was active from 1788 to 1817. He played most of the tragic heroes with success, but other members of his brilliant family equalled him. His sister Sarah, Mrs. Siddons (q.v.), was the greatest of Lady Macbeths, and his niece Fanny won great fame for her Juliet. Kemble as manager revived some minor Shakespearian plays which had been long off the stage.

Edmund Kean (q.v.) exemplified romantic interpretation at its height; he appeared first at Drury Lane on 26 Jan. 1814, and for the younger generation he immediately supplanted Kemble. Praise of him by Leigh Hunt, Hazlitt, and Lamb has become literature. He was especially famous for Shylock, his first role, Othello and Richard III.

W. C. Macready in the 1830's tried to keep alive the old system of large patent theaters but failed. Two of his actors were great: Helen Faucit, the finest actress of the romantic heroines, and Samuel Phelps, who, after being held back by Macready, came into his own with the failure of the big theaters and the repeal of the Licensing Act in 1843. At Sadler's Wells he presented Shakespeare for 30 years; he revived all but seven of the plays and he scorned «improved» texts.

From 1850 to 1879 Charles Kean at the Princess's Theater started the elaborate, scholarly, and heavy productions which continued through the age of Henry Irving and Beerbohm Tree. This smothering of the play by the production was stopped in the 20th century by the influence of Gordon Craig and Granville-Barker.

The 'Old Vic' in London still keeps the tradition alive, and actresses from Ellen Terry to Helen Hayes, actors from Irving to John Barrymore, John Gielgud and Maurice Evans have used the plays of Shakespeare for their greatest achievements. See also SHAKESPEARE, AUTHORSHIP OF.

Kittredge, Boston 1936, 1 vol.).

HALLETT D. SMITH,
Associate Professor of English, Williams College.

SHAKESPEARE, Authorship of. The question of the authorship of the plays now or formerly published under Shakespeare's name has turned in several directions and has had many ramifications. The first of these is the apocrypha, plays ascribed to Shakespeare in his lifetime or later but not now included in the canon. The second is the question of whether

William Shakespeare of Stratford was actually the author of the plays of the canon, or if his name has merely been put to plays which are the work of another man. The third is the question of whether the plays in the canon are collaborations, or plays by other men slightly revised by Shakespeare, or plays drafted by Shakespeare and finished by other writers.

Apocrypha.—The canon begins with 36 plays included in the First Folio, 1623. Two other plays are usually now added, 'Pericles' and 'The Two Noble Kinsmen,' although it is not contended that Shakespeare is the sole author of these. Many scholars would add a part of 'Sir Thomas More.'

During Shakespeare's life four other plays were attributed to him on the title page of an edition. 'The First Part of Sir John Oldcastle' appeared in 1600 in two editions, one of which bore the words «written by William Shakespeare,» the other anonymous. The editors of the Third Folio (1664) and the Fourth Folio (1685) reprinted the spurious quarto. The actual authorship is revealed in the diary of Philip Henslowe, manager of the rival company to Shakespeare's. Munday, Drayton, Wilson, and Hathway collaborated on this drama as an answer to the popular Falstaff plays of the Chamberlain's men. (Shakespeare's Falstaff was originally named Oldcastle.) Two other plays bore Shakespeare's name while he was still alive: they are 'The London Prodigal' (1605) and 'A Yorkshire Tragedy' (1608). Today, they are both universally rejected as his, because the former is a comedy of humours and manners, the latter a tabloid play about a contemporary murder. Shakespeare is not known to have done anything like either of these, and they bear no traces of his style. Three plays before 1616 carried the initials W. S., and one of them 'Thomas, Lord Cromwell,' was also said to have been acted by the company to which Shakespeare belonged. The 1611 edition of 'The Troublesome Reign of King John' (not the 'King John' in the Folio) was attributed to 'W. Sh.' These attributions carry no authority at all. Other attributions were made in the 17th century, by booksellers and others, of plays ranging from the most popular of all Elizabethan trashy plays, 'Mucedorus,' to the fine history play 'Edward III,' possibly by Peele, and the best of the plays about contemporary murders, 'Arden of Feversham.' The Shakespeare Apocrypha have been collected and edited by Tucker Brooke (Oxford 1908).

Baconian Theory.—During the 19th century much excited controversy was stirred up by the thesis that Shakespeare's plays were written by Francis Bacon. This unproved theory had its root in the idea that Shakespeare could not have had the education or the background of experience to write the plays, while Bacon's great intellectual faculties were equal to the task. An American woman, Delia Bacon, was the first important proponent of the idea. She was encouraged temporarily by Emerson, Carlyle, and Hawthorne, went to England to secure «proof,» published 'The Philosophy of the Plays of Shakespeare Unfolded' in 1857, and soon after became obviously insane. The next important contribution to the theory came from the Minnesota politician, reformer and popular orator, Ignatius Donnelly. He worked out, in 'The Great Cryptogram' (1888), a cipher by which the Baconian authorship could be demonstrated. All restraints on the imagination of Baconians were removed by this device, and soon investigators like Mrs. E. W. Gallup ('Francis Bacon's Bi-Literal Cypher,' 1899) were revealing that Bacon wrote not only Shakespeare but also Marlowe, Jonson, Peele, Greene, Spenser, and Burton's 'Anatomy of Melancholy.' Bacon was, it seems, the son of Queen Elizabeth and Leicester, rightful Prince of Wales, and he wrote literature in order to complain of his lot, in cipher, to future researchers. All of these ciphers which tell anything can be made to tell too much; that is, they work equally well on books published long after Bacon's death. No adherent of the Baconian school was a trained and professional literary scholar, but the heresy had a wide appeal to amateurs. The devotees explained the absence of converts among trained scholars to prejudice, and the ridicule to which their efforts were subjected had little effect. Many Baconians lectured persuasively and brilliantly, even though their writings are ponderous and dull.

Since about 1910 the Baconian heresy has declined, and its place has been taken by the theory that some other lord was the real author of the plays. Perhaps the leading candidate at present is Edward de Vere, 17th Earl of Oxford, whose contemporary reputation as a writer is now supported only by a few lyrics. His claim to the plays of Shakespeare was first put forward by J. Thomas Looney in 1920, and it has been supported by Captain B. M. Ward's biography, 'The 17th Earl of Oxford' (1928), several works by Percy Allen, George Frisbee's 'Edward de Vere' (1932), and M. W. Douglas' 'Lord Oxford was Shakespeare' (1935). But the glittering and Italianate Oxford does not hold the field alone; he has rivals in several other prominent Englishmen. In 1919 Professor Abel Lefranc of the Collège de France devoted two volumes called 'Sous le masque de Shakespeare' to the cause of proving that William Stanley, 6th Earl of Derby, wrote the plays. Another French writer, C. Demblon, had already, in 1912, advocated Roger Manners, 5th Earl of Rutland. Peter Alvor, the German, has been fickle in his heresy, favoring a collaboration of Southampton and Rutland in 1907, Anthony Bacon in 1911, and Charles Blount, 8th Lord Mountjoy and Earl of Devonshire, in 1930. Sir Walter Raleigh was nominated for the honor in 1914 by Henry Pemberton, Jr. In a sense, these various theories cancel each other, and there would seem to be no reason why the list of true authors of Shakespeare could not be expanded further, since there were other courtiers and aristocrats of the time who could write. All this is of interest principally to show how the Baconian skyrocket explodes in a shower of sparks before the dead stick finally falls to earth.

Disintegration.—The attack on the integrity of the canon begins with F. G. Fleay, ('Shakespeare Manual,' 1876, and 'Life and Work of Shakespeare,' 1886), who proceeded from the idea that Shakespeare's plays in the old texts show signs of extensive revision to the conclusion that the matter being revised was not by Shakespeare but by a predecessor. The plays in the canon were thus seen as pieces of patchwork, part original Shakespeare, part Shakespeare revision, part unretouched frag-

ments of Marlowe, Greene, Peele, Lodge, and many others. This approach has been represented more recently by J. M. Robertson ('The Shakespeare Canon,' 1922, 'State of Shakespeare Study,' 1931, and 'Literary Detection,' 1931). His method is to judge first from subjective impressions, a feeling that a particular passage does not sound like Shakespeare; then he applies metrical tests, which have been devised to settle the problem of the chronology of Shakespeare's plays, and finally he searches for clues—words, figures or expressions which are not common in Shakespeare but are common in some other author. Underlying it all is the conviction that Shakespeare, being a great writer, could never write anything that was hasty, or stiff, or awkward or bombastic. Most of what he finds non-Shakespearian he attributes to Chapman or to Marlowe. There is no external evidence whatever to support the conclusions. In order to believe them one must believe that the Folio editors, Hemings and Condell, either did not know or chose to conceal the fact that they were publishing under the name of their fellow Shakespeare some plays on which he did only a slight amount of retouching and revising. And the methods Robertson used are dubious even as internal evidence. Percentage figures of feminine endings and of rhyme in the verse may prove something if a whole play is being considered, but these figures lose their significance when they are applied to a single scene or short passage. Furthermore, no clear-cut assignment of vocabulary, tricks of style, and mannerisms has ever been made among all the Elizabethan dramatists and poets. For these reasons the disintegrators have not convinced the great majority of Shakespearian scholars, who seem willing to believe that Shakespeare, like Homer, occasionally nods, and that without being superstitious about it we can safely accept the contents of the First Folio as the work of William Shakespeare of Stratford, gentleman. The best reply to the disintegrators is the lecture by Sir E. K. Chambers before the British Academy in 1924 called 'The Disintegration of Shakespeare.' See also SHAKESPEARE, WILLIAM.

HALLETT D. SMITH,
Associate Professor of English, Williams College.

SHAKESPEARE SOCIETIES. The first Shakespeare society was founded in 1841, in London, and before its dissolution in 1853, had published 48 volumes. A new English Shakespeare society was organized in 1874, and the German Shakespeare Society was founded at Weimar in 1864. In the United States the Shakespeare Society of New York was organized in 1885. The latter has published the 'Bankside Shakespeare' (20 vols., 1888–92) and 'The Bankside Restoration Shakespeare' (1907). The Shakespeare Association was founded in London in 1914 and the late Israel Gollancz was chosen first president. The newly founded Shakespeare Association of America has through its annual dinners and its plans for Shakespeare centres in America done much to keep public interest alive.

SHAKESPEARE'S SONNETS. The Sonnets of Shakespeare were published in 1609, in a small quarto volume which is generally thought to have been «piratical,» that is, to have been issued without the author's consent. The circulation of poems in manuscript form was a common matter in the Elizabethan age, and there is direct evidence that it had been taking place in the case of these sonnets; for Francis Meres, in a little work called 'Palladis Tamia,' published 1598, observed: «As the soul of Euphorbus was thought to live in Pythagoras, so the sweet witty soul of Ovid lives in mellifluous and honey-tongued Shakespeare, witness his 'Venus and Adonis,' his 'Lucrece,' and his sugared Sonnets among his private friends.» In the following year, 1599, two of the sonnets were published in the piratical compilation called 'The Passionate Pilgrim.' For these and other reasons it is assumed that a good part of Shakespeare's Sonnets had been written a considerable time before the publication of the volume of 1609; but as to the period of his life most likely to be represented by them, there is no general agreement. Some critics regard them as early compositions, largely completed by 1594–96; others as having been written largely in the period 1598–1603; while still others assume, in the absence of definite evidence, that they may have been produced at intervals throughout Shakespeare's literary life. It is agreed, however, that few are to be attributed to his later period, that is, after 1603.

The Sonnets are 154 in number, and are written in the form sometimes called «English» to distinguish it from the more orthodox «Italian» sonnet form; that is, each of them is divided into four quatrains and a final couplet, by the rhyme-scheme *abab, cdcd, efef, gg.* This form had already been used successfully by Samuel Daniel in a popular collection of sonnets, and it is to his influence that the general form and style of Shakespeare's are most commonly traced; though it is also likely that he had studied the sonnets of Sir Philip Sidney, by far the finest sonneteer of the early Elizabethan age, and perhaps those of Michael Drayton as well. How far Shakespeare was acquainted with the work of Italian and French sonneteers we have no means of knowing. None of his sonnets appears to be a translation or direct imitation of a particular source; on the other hand, the themes and rhetorical methods of the continental poets abound in his sonnets, as in those of his English contemporaries, and there is no reason to doubt that he was familiar with the general character and course of the sonnet-writing fashion, which came into England from Italy and France, and reached its height there about 1594–96. A great part of these Renaissance sonnets were issued in the form of «sequences,» that is, collections centred around a single theme,— usually a woman (real or ideal) beloved by the poet,— and capable of being read either as single poems or as a connected account of the poet's subjective experiences. In the case of Shakespeare's Sonnets, it is disputed whether they are to be regarded as forming a sequence or not. They have no title or otherwise clearly defined theme; and we cannot say whether they were printed from a single manuscript or from scattered collections, nor whether the order in which they stand in the quarto of 1609 is that in which they were written or that in which they would have been published if Shakespeare

had prepared them for the press. Hence the only evidence as to the unity of the series is internal; and many critics find themselves able to read it as a connected story, while to others it seems to be a mere miscellany, though containing many pairs, trios, and perhaps larger groups of sonnets intended to be read connectedly. The weight of opinion may be said to be that there is a certain unity in the collection, suggestive of the view that the great part of the sonnets have to do with the same persons and events, but that there is no complete continuity such as would result from an authoritative arrangement either for narrative or lyrical ends. As a result of this uncertainty regarding the arrangement of the Sonnets, they have been rearranged by many editors and critics, in accordance with individual theories. Perhaps the most plausible and useful of these rearrangements is that of C. M. Walsh, in his edition of 1908; this is based not on any constructive theory, but on the effort to group the sonnets according to internal evidence as to content and style, and therefore errs — if at all — in the direction of an unnecessary breaking up of possible sequences.

The opening sonnets, as they stand in the volume of 1609, are addressed to a young man, apparently of good family and striking personal charms and gifts, who is urged by the poet to marry in order that he may beget children to perpetuate his qualities and so, in a sense, overcome the ravages of time and death. Many of the following sonnets apparently either refer to or are addressed to the same young gentleman, and it is *possible* to read every one of them, up to and including the 126th, as having reference to this person,— though many of the number, if standing by themselves, would be assumed to be addressed to beautiful women. For this reason Sonnets 1–126 are frequently called the First Series, and it is assumed that they came into the publisher's hands as a body. Moreover, the sonnets from 127 to 152 inclusive have chiefly to do with a woman, dark of complexion and dark of character, and all of these *can* be read as concerned with this theme; hence this group is frequently called the Second Series. (Sonnets 153 and 154 admittedly stand quite by themselves as mere literary exercises.) A link between the two series is found in the fact that Sonnets 40–42 on the one hand, and 133–136 on the other, appear to refer to the same event, namely, an intrigue between the beautiful young man and the dark woman, in which it would seem that both proved untrue to their poet friend. Sonnet 144 may be viewed as the more definite key to this triangle; it is the famous poem in which the writer speaks of having «two loves»:

> " The better angel is a man right fair,
> The worser spirit a woman colour'd ill."

Obviously, this group of sonnets raises with peculiar interest the question which attaches in some form to most of the sonnet sequences, — how far the writer speaks literally of himself, that is autobiographically, how far conventionally or imaginatively. Students of Shakespeare's Sonnets have differed widely, sometimes bitterly, on this question, and all possible answers to it may be found, ranging from the extreme view that the story is a wholly imaginative one, with no more reference to Shakespeare's personal life than that of Romeo or Othello, to the opposite extreme, that we have in his sonnets a perfectly clear and definite record of his friendship for an attractive but faithless young man and a repulsive yet strangely fascinating woman. The interpreters of the latter sort have also made strenuous efforts to identify the persons concerned; a number of them, in particular, having determined that the young man friend is Henry Wriothesley, Earl of Southampton, others being equally certain that he is William Herbert, Earl of Pembroke. The dispute is complicated by the curious circumstance that the publisher of the sonnets dedicated them to a «Mr. W.H.,» whom he called their «only begetter,» and it has been assumed that this should give a clue to the person addressed in the First Series. All these matters are still in debate, and there is no reason to expect any unquestioned solution. In general, modern criticism tends to agree on the view that a good part of these sonnets, including those concerned with the intrigue with the dark woman, were of definite personal significance (chiefly because, if Shakespeare had set out to tell an imaginative tale, he would have done it better and more clearly than he has told this one), but at the same time that they represent conventional moods and manners familiar to Shakespeare's contemporaries, and are therefore not to be taken so seriously by students of his life as many have done. It is certain that none of the attempted identifications has been proved.

The disputes concerning the arrangement and the biographic significance of the Sonnets have tended to obscure the question of their poetic qualities. In general, here as with Renaissance poetry as a whole, it is necessary to distinguish between qualities peculiar to that age and those of permanently vital character. Chief among the former group is Shakespeare's use of the «conceit,»—that is, the ingenious elaboration of a verbal or imaginative figure,— a habit common to most of the Renaissance lyrists, and consonant with Shakespeare's taste, especially in his more immature periods. Notable examples of this are to be found in Sonnets 8, 24, 43, 46–47, 99, 132, 135–136 and 145. As a lyrical method this is of course opposed to the canons of modern taste, and in the 18th century, when criticism was disposed to deal with special severity with Renaissance ingenuities, the poems of Shakespeare suffered a corresponding depreciation; Steevens, one of the leading editors of the plays, refused to admit them to his edition of the Works of Shakespeare, saying that no act of Parliament would compel readers for the Sonnets. On the other hand, it is now universally admitted that in many of these sonnets we have unsurpassed examples of the power of lyrical poetry to express personal feeling in concentrated form. In particular, they deal with the theme of the struggle of human love and beauty against the arch-enemies Time and Death — now representing these enemies as triumphant, now finding in poetry a means of overcoming them, but chiefly finding such a means in the unconquerable power of love.

From this standpoint Sonnet 116 may be viewed as the climax of the collection:

> "Love alters not with his brief hours and weeks,
> But bears it out even to the edge of doom."

Other sonnets of importance for their content or lyrical beauty are 18, 29, 30, 31, 52, 55, 60 64, 71, 73, 74, 90, 97, 102, 106, 129, 146.

The most comprehensive edition is the variorum edited by R. M. Alden (1916); it contains very full notes, critical apparatus, and a history of the criticism of the sonnets. The second revised (English) Arden edition, by C. K. Pooler (1931), should also be mentioned. J. A. Fort's 'A Time Scheme for Shakespeare's Sonnets' (1929) is now generally accepted on matters of date. Janet Scott's 'Les sonnets élisabéthains' (1929) should be read with Sidney Lee's 'Life of Shakespeare' on the sources. The best rearrangement of the sonnets, and probably the best introduction to them, may be found in the edition of Professor Tucker Brooke (1936).

SHAKTAS. See RELIGIOUS SECTS.

SHALE, a sedimentary rock made up largely of compacted clay with admixture of other finely ground rock material, and splitting into thin layers parallel to the bedding plane. In the typical shales the rock splits with a conchoidal or shelly fracture, the surface being marked by wide shallow depressions rather than by absolute smoothness. In composition, shales may be purely argillaceous, but they are generally more or less silicious, calcareous, ferruginous or carbonaceous, according to the material admixed with the clay. The carbonaceous shales are often used for the manufacture of oil or gas, some of them being so rich in carbon as to burn with a bright flame. These are called oil shales, or kerosene shales. Alum shales are clay shales rich in iron pyrites which on decomposing permits the formation of sulphuric acid, which in turn reacts upon the clay shale with the formation of alum. Calcareous shales are largely used in the manufacture of Portland cement.

SHALER, shā'lėr, **Alexander,** American soldier: b. Haddam, Conn., 19 March 1827; d. 1911. He was educated in private schools and graduated from Brainard Academy in 1844. In 1845 he joined the Washington Grays (later known as Eighth regiment New York State militia) and transferred to the Seventh regiment in 1848, becoming major of that regiment in 1860. He was commissioned lieutenant-colonel of the 65th New York Volunteers on the outbreak of the Civil War, and became colonel in 1862, commanding the military prison at Johnson's Island, Ohio, during the winter of 1863–64. He served with the Army of the Potomac, participating in all its battles, until 6 May 1864, when he was taken prisoner at the battle of the Wilderness, and was held in Charleston, S. C., during the summer of that year. After his exchange he commanded a division in the Seventh corps and the post of Duval's Bluffs, Ark., serving in the Southwest until he was mustered out 24 Aug. 1865. He was commissioned brigadier-general of volunteers in 1863, and brevetted major-general of volunteers in 1865. From 1867 until 1870 he was president of the board of commissioners of the Metropolitan fire department, and commissioner of the fire department of New York 1870–73. He was consulting engineer to the Chicago board of police and fire 1874–75, being charged with the reorganization and instruction of the fire department of that city. From 1867 till 1886 he was major-general of the first division of the National Guard of the State of New York, and was an organizer and president of the National Rifle Association of the United States. While a member of the board for the purchase of sites for armories he was accused of bribery, but although he was tried twice the jury disagreed each time. General Shaler published a 'Manual of Arms for Light Infantry Using the Rifle Musket' (New York 1861).

SHALER, Nathaniel Southgate, American geologist: b. Newport, Ky., 20 Feb. 1841; d. Cambridge, Mass., 10 April 1906. He was graduated from the Lawrence Scientific School, Harvard, in 1862, served in the Union army as an artillery officer, and then returned to the Lawrence School, where he was assistant and instructor in geology and zoology He accepted the chair of palæontology at Harvard in 1868, was transferred in 1887 to that of geology, and he was dean of the Lawrence School from 1891. In 1873–80 he was in charge of the Kentucky geological survey, and from 1884 was director of the Atlantic division of the United States geological survey. He was commissioner of agriculture for the State of Massachusetts at different times, was president of the Geological Society of America in 1895; and besides numerous reports for the United States geological survey published 'Kentucky Geological Reports and Memoirs' (7 vols., 1876–82); 'The Story of Our Continent' (1892); 'The Interpretation of Nature' (1893); 'The United States of America' (2 vols., 1894); 'The Individual: Study of Life and Death' (1900); 'The Citizen: A Study of the Individual and the Government' (1904); 'The Neighbor' (1904); 'Man and the Earth' (1905). Consult 'The Autobiography of Nathaniel Southgate Shaler,' with a memoir by his wife (New York 1909), etc.

SHALLOON, a light woolen textile said to derive its name from Châlons in France, where it was originally manufactured.

SHALLOP, a light fishing-vessel with two masts and carrying lug or fore-and-aft sails; also a small boat for one or two oarsmen.

SHALLOT, or **ESCHALLOT,** a perennial bulbous plant (*Allium ascalonicum*) of the order *Liliaceæ*. The bulbs are seldom two inches long and an inch in diameter. They send up hollow small leaves which are often used for mixing with salads and dressings, or are eaten alone. The bulbs are also similarly used. They are planted in early spring in rich soil about four inches apart, in rows 15 to 18 inches apart, and kept cleanly cultivated throughout the season. The leaves may be cut at any time and the bulbs taken up in autumn, dried like onions or garlic, and kept in a dry, cool place. From two to six bulbs are usually produced by each bulb planted. In the South they are generally planted in the autumn and even in the North they may be left in the

ground over winter. They are less grown in the United States than in Europe.

SHALMANESER, shăl-mą-nē'zẽr, second of his name, the Assyrian king, who in 853 B.C. defeated Benhadad with his ally, Ahab, king of Israel, at Karkar, the Biblical Kirharaseth (2 Kings iii, 25), on the Orontes. Shalmaneser did not gain a decisive victory over his foes, as he was unable to proceed to Damascus and to wage war against his other enemies; he was worsted in battle by the Chaldeans of Armenia. See AHAB; ASSYRIA.

SHAMANISM, a vague term used by explorers of Siberia in the 18th and 19th centuries to designate not a specific religion but a form of savage magic or science, by which physical nature was believed to be brought under the control of man. It prevails among Turanian and Mongolian tribes and American Indians, and blends with their varied religious beliefs and customs. Shamanism rests for its basis on the animistic view of nature. Animism teaches that primitive and savage man views the world as pervaded by spiritual forces. Fairies, goblins, ghosts and demons hover about him waking or sleeping; they are the cause of his mishaps, losses, pains. Mountains, woods, forests, rivers, lakes are conceived to possess spirits, and to be living, thinking, willing, passionful beings like himself. In respect to these, man is in a state of helplessness. The shaman by appropriate words and acts uses his power to shield man and envelops him in a kind of protective armor so that the evil spirits become inactive or inoffensive. His rôle is that of antagonist to the spirits and of guardian to ordinary man. The Eskimos believe all the affairs of life are under the control of malignant spirits who are everywhere. These minor spirits are subject to the great spirit Tung-Ak, yet must be propitiated. The shaman alone is supposed to be able to deal with the great spirit, though not superior to him. The main principle of Shamanism is the attempt to control physical nature. Hence the term embraces the various methods by which the spirits can be brought near or driven away. The belief that the shaman practises this magic art is universal among savages. To this art nothing seems impossible; it intimately affects their conduct and is reflected in their myths. In some cases initiation is required. Thus with the Navajo and Ojibwas they who have successfully passed through the four degrees of the *medéwin* are called *medé*, and are considered competent to foresee and prophesy, to cure diseases and to prolong life, to make fetishes and to aid others in attaining desires not to be realized in any other way. They who have received instruction in one or two degrees usually practise a specialty, e.g., making rain, finding game, curing diseases, For this women are eligible. Most commonly the shaman is a man. Among the Yakuts, the Carib tribes and in northern California there are female as well as male shamans; and in some cases male shamans have to assume women's dress. Every Maori warrior is a shaman. In Samoa there is no regular caste, but in other Polynesian groups the shaman is the exclusive privilege of an hereditary class of nobles. In the practice of his art the shaman is regarded as (1) a healer, hence the term «medicine man,» and the secret medicine societies of the Seneca, and of other American tribes; (2) an educator, i.e., the keeper of myth and tradition, of the arts of writing and divination; he is the repository of the tribal wisdom; (3) a civil magistrate; as seers possessing secret knowledge with power at times of assuming other shapes and of employing the souls of the dead, they are credited with ability to detect and punish crimes; (4) a war-chief; thus with the Dakotas and Cheyennes the head war-chief must be a medicine-man. Hence the shaman possesses great influence and in many cases is the real ruler of the tribe. The means which he uses are (1) symbolic magic, on the principle that association in thought must involve similar connection in reality; (2) fasting with solitude and very generally bodily cleanness and incantations usually in some ancient or unmeaning language and at times obscene; (3) dances and contortions with use of rattle and drum and a distinctive dress decked with snakes, stripes of fur, little bells. The frenzy and contortions lead to an ecstatic state which is considered of the greatest importance. In South America drugs are used to induce stupor; (4) possession; thus in Korea the *pan-su* is supposed to have power over the spirits, because he is possessed by a more powerful demon whose strength he is able to wield.

Shamanism is closely akin to fetishism, and at times it is difficult to tell whether the practices in vogue among certain peoples should be referred to the one or to the other. Both spring from Animism; both are systems of savage magic or science and have certain rites in common. Yet the differences consist in the belief that in fetishism the magic power resides in the instrument or in particular substances and passes into or acts upon the object, whereas in shamanism the will-effort of the magician is the efficient factor in compelling souls or spirits or gods to do his will, or in preventing them from doing their own. Shamanism takes for granted the theory that fear is the origin of religion. Shamanism is not a religion. The religious priest beseeches the favor of the gods; the shaman is believed to be able to compel and command them to do his will. Hence the term is not to be regarded as a name for a principal form of religion but for important phenomena and tendencies of Animism. Consult 'Reports of the Bureau of American Ethnology' (Washington, D. C., annually); Achelis, T., 'Moderne Völkerkunde' (Stuttgart 1896); id., 'Abriss der vergleichenden Religionswissenschaft' (Leipzig 1904); Frazer, J. G., 'The Golden Bough' (New York 1900–12); Müller, 'Contributions to the Science of Mythology' (London 1897); Lang, 'Myth, Ritual and Religion' (ib. 1887); Keane, 'The World's Peoples' (New York 1908); Furlong, 'The Faiths of Man' (London 1906); *Journal* of American Folklore (January 1908); Tumholtz, C., 'Unknown Mexico' (New York (1902); Maddox, J. L., 'The Medicine Man' (New York 1923).

SHAMASH, or **SAMAS**, the sun god of Babylonia and Assyria. Inscriptions designate him as the offspring of Sin, the moon god, the moon power in the earlier, nomadic times being

the dominant deity. With the development of agriculture the importance of the sun god grew, and he became one of a triad with Sin, the moon god, and Ishtar, the earth god. To Shamash were attributed powers of justice and right, evil being supposed to flee before the power of light, and he was likewise the god of healing. His wife was A, Aa, or Ai, and in inscriptions is the "lady of mankind" and the "lady of the countries." His children were Kettu (justice) and Mesharu (right), although these are also referred to with other minor sun gods, such as Bunene, as servitors of Shamash. Ninib, the sun god of the morning and of spring, and Nergal, god of moon and summer, however, retained their powers under the headship of Shamash. The principal places of worship were Sippara, the Sepharvaim of the Bible; and Larsa, the modern Senkereh; the sanctuary in both cities being called E-barra or E-babbara, "the shining house." Other temples of his worship were built at Babylon, Ur, Nippur, and Nineveh.

SHAMOKIN, sha-mō'kĭn, Pa., borough in Northumberland County; altitude 730 feet; on Shamokin Creek, a tributary of the Susquehanna River; 18 miles southeast of Sunbury and 45 miles northeast of Harrisburg, the state capital; on the Reading, and the Pennsylvania railroads. It is the industrial and commercial center of a region rich in anthracite coal. The leading industries are silk, knitting, and linen mills; beef and pork products plants; dress, shirt, yarn, and hair net factories. A great number of the inhabitants of the borough are employed in the mines in the vicinity. St. Edward's Roman Catholic Church, erected in 1873, is said to have been the first church in the world lighted by electricity. The majority of the inhabitants are native born, but there are a number from Wales, Poland, Hungary, Germany, and also from England, Ireland, and Scotland. Coal was found here as early as 1770. Shamokin was settled in 1835 by people employed in developing the coal mines, and coal mining began here on a large scale in 1840. Most of the borough's buildings occupy the bottom of a mountain bowl, while its irregularly arranged streets stretch up the surrounding slopes. Pop. (1940) 18,810; (1950) 16,879.

SHAMROCK, a name derived from the Irish *seamrog,* meaning "trefoil," and applied to various trifoliate plants native to Ireland, and even to the water cress (which is not three-parted). Each is said to be the plant picked by Saint Patrick as a symbol to illustrate the doctrine of the Trinity. The shamrock is worn on Saint Patrick's Day, March 17, and has come to be regarded as the national plant of Ireland. The black medic (*Medicago lupulina*), *Oxalis acetosella,* various clovers, such as the common red clover (*Trifolium pratense*), a trailing hop clover, with small leaves and yellow heads (*Timinus*), and the common low, white clover (*T. repens*), are widely sold as the true shamrock, and exported in large quantities to the United States and other countries, where Irishmen make a custom of wearing the sprays on Saint Patrick's Day as a reminder of home associations.

SHAN STATES, a group of states in central Indochina, named from the Shan (or Tai) who inhabit them. The 6 Northern and 28 Southern Shan States of eastern Burma, federated in 1922 and in 1947 still administered as part of British Burma, have an area of 57,816 square miles, and an estimated population of 1,615,765. The Shan territory, traversed by the Salween River and its branches, extends roughly from a line drawn north and south through Mandalay to the most easterly point of Burma, on the Mekong River, forming an approximate triangle. Agricultural activities include the growing of rice, sugarcane, cotton, and tea, and the breeding of horses and cattle. There are teak forests and some pine. In 1938 the Northern Shan States produced 5,920,000 troy ounces of silver; and there are considerable quantities of soft coal, and some gold in the river bottoms. The inhabitants are of the southern Mongoloid group of peoples, and are said to have originated in southwest China. They are ethnologically related to other groups in Indochina, south China, and Assam, and linguistically (through their common use of the Tai or Shan language) to the Karen of central Burma and to certain of the Siamese. Taunggyi, the chief town, and the meeting place of the Council of Chiefs, is in the southwestern part of the territory, near the terminus of a railway from Thazi, on the line from Rangoon to Myitkyina.

SHANG or **YIN DYNASTY,** an early Chinese dynasty (c. 1523–1027 B.C.), of unknown origins, the rulers of which held sway over a region north and south of the Yellow River, from the Pacific coast perhaps as far west as present-day Shansi. Articles of the Shang period discovered in 1928 in caves along the Huan, a Yellow River tributary, indicate the existence of a feudal system and a state religion, a calendar based on a year of six 60-day cycles, wheeled vehicles, cultivation and storage of grains such as millet, wheat, and perhaps rice, the casting of bronze weapons and tools, and the use of a developed written language of at least 2,000 words. One of the Shang capitals is known to have been established near the site of modern Anyang (Changte), in Honan Province, soon after 1400 B.C. The dynasty may have included as many as 31 monarchs. Its collapse seems to have given rise to the early Korean monarchy. There is a tradition that when the Shang dynasty was overthrown by Chu invaders from the west during the 11th century, certain Shang remnants under Ki Tse (Chi-tzŭ, ki-ja), escaping to Korea, may have set up a kingdom there which lasted some 900 years. See KOREA—*History.*

SHANGHAI, the largest city of China and formerly sixth among the world's ports, is in the province of Kiangsu, near the junction of the Hwangpoo (Whangpoo) and the Woosung rivers, 12 miles from the mouth of the Yangtze River and about 150 miles southeast of Nanking. It is the terminus of the Shanghai-Nanking and Shanghai-Hangchow railways. Linked to the Americas and Europe by sea and air, and to China's hinterland by the Yangtze River, railways, and highways, Shanghai is the largest port in the Far East, and has been called the New York of China.

It has an area of over 300 square miles, and formerly was divided into two areas: the sections directly under Chinese sovereignty; and the sections which included the International Settlement and the French Concession. The Chinese areas,

particularly Nantao and Chapei, are called Old Shanghai, the center of which was once surrounded by a wall 24 feet high, pierced by six gates. This section grew up without planning, so that the streets are narrow and dirty, and the buildings low and crowded; but modern sanitation and other improvements are being introduced. In 1930 the national government began an extensive building program to develop Greater Shanghai as a model Chinese municipality. The program mapped by the City Planning Commission of Greater Shanghai included a mayor's building, a library, a museum, a medical center, school buildings, a sport center, and airdromes. Scores of new Chinese hotels equipped with modern appliances sprang up and new apartment houses and modern office buildings were constructed. Japan's invasions of Shanghai in 1932 and 1937 put an end to this program and destroyed many new buildings already finished. The foreign settlement, which suffered no damage during either of the Japanese attacks, stands on the left bank of the Hwangpoo, below the Chinese city, from which it is separated by a moat spanned by several bridges. It is composed of what was formerly the French Concession and the International Settlement, the latter being made up of the original United States and British concessions. The former foreign settlements contain the principal commercial centers, the Bund (central section along the river), and foreign residential quarters. Before the abolition of the foreign concessions in Shanghai, the French Concession, the International Settlement, and the Chinese city were administered separately, each having its own courts and police system. The French Concession and the International Settlement were controlled by councils dominated by the foreign residents. Post-concession Shanghai is governed by a mayor appointed by the national government; it is one of the special municipalities of China. After eight years of Japanese occupation, practically all public installations, such as roads, wharves, bridges, and other municipal constructions were returned to China in a dilapidated state. Plans were made to start reconstruction along various lines: city planning, and construction of roads and thoroughfares, bridges, wharves, and buildings. Serious inflation, soaring prices, strikes, and material and housing shortages hampered the Shanghai program, so that in 1947, Shanghai was one of the most expensive cities in the world to live in.

Shanghai has water communication with about one third of China, and the steamship lines operating in Shanghai carry cargo and passengers to and from all parts of the world. The port of Shanghai extends from the upper branch of the Hwangpoo to Woosung, a distance of about 12 miles, connected by rail, anchorage for large vessels extending four miles below the former settlement. The anchorage used to be divided into sections, defining the foreign from the Chinese boundary, all vessels being anchored abreast and lettered according to their positions, and steamers being separated from sailing ships. The harbor in Shanghai is not very deep, and because of the silt flowing into the harbor from the river it is becoming still shallower. During the Japanese occupation, dredging of the harbor was not kept up. In the first year following Japan's surrender, Shanghai did not recover its position as the Orient's leading port.

Prewar Shanghai accounted for a substantial part of the republic's foreign trade. The principal exports are tea, tung oil, bristles, silk, silk materials and products, beans and bean cake, cotton goods, and piece goods. The chief imports are all types of manufactures, chemical products, metals and metal manufactures, food, tobacco, rice, wheat, and textiles. To offset the unfavorable balance of trade, the national government in 1946 removed export duties and restricted certain imports. In 1946 the city's trade was still far from normal. Over half of China's prewar industries were concentrated in the Shanghai area, but a great majority of them had not resumed production. Practically all the foreign and Chinese banks have their headquarters in Shanghai. The chief mission establishments in China, including several Christian colleges and high schools, are also concentrated there. Americans, British, French, and other nationals have their own churches, schools, and social organizations. Shanghai is a cosmopolitan center for the Orient.

Shanghai was one of the first ports opened to foreign trade after the Opium War of 1839–1842. The International Settlement and the French Concession were established in 1842–1845 and 1849 respectively. After the first Chinese-Japanese War, in 1895, foreign factories were established in Shanghai, and about 1900 its harbor was improved. After the birth of the Chinese Republic, Shanghai developed rapidly into a leading city. When the nationalist army under Generalissimo Chiang Kai-shek occupied it in 1927, the city government of Greater Shanghai was formally inaugurated under the direct control of the national government. In 1932 the Japanese bombarded Shanghai and occupied part of it for about three months; and from August to November 1937, China defended it at a tremendous sacrifice against the second Japanese invasion. After Pearl Harbor, Japan assumed control of the foreign settlements in Shanghai. In 1943, China concluded new treaties with Great Britain and the United States abolishing the international settlements and foreign concessions in China, including those in Shanghai. After eight years of occupation the Japanese formally returned Shanghai to the Chinese in September 1945. Pop. (official est. 1945–1946) 3,766,111.

HUNG-TI CHU,
Former Head of Information and Research Departments, Chinese News Service, New York City.

SHANGHAI, a breed of fowls. See POULTRY.

SHANHAIKWAN, shän'hī'kwän', China, a town in northern Hopei, where the Great Wall ends at the Gulf of Liaotung, on the railway from Tientsin to the Manchurian provinces. Historically important as a defense point, it was taken by the Japanese in 1932 as a key to the Province of Jehol, which they included in their puppet state of Manchukuo. Pop. (est.) 30,000.

SHANKLIN, William Arnold, American clergyman and educator: b. Carrollton, Mo., April 18, 1862; d. New York, N. Y., Oct. 6, 1924. He was graduated at Hamilton College in 1883 and took his S.T.B. at Garrett Biblical Institute in 1891. He was ordained in the Methodist Episcopal ministry in 1889, and held pastorates in Kansas, Washington, Iowa, and Pennsylvania in 1887–1905. He was president of Upper

Iowa University in 1905–1909, and from 1909–1923 president of the Wesleyan University.

SHANKS, William Franklin Gore, American journalist: b. Shelbyville, Ky., April 20, 1837; d. Hamilton, Bermuda, Feb. 22, 1905. He was a war correspondent for the New York *Herald* during the Civil War, afterward held various editorial posts on that and other New York papers, and was managing editor of *Harper's Weekly,* 1867–1869. While city editor of the *Tribune* he was imprisoned for contempt of court for refusal to divulge the name of the writer of an article in the paper, taking the ground that he was a privileged witness. After his release he brought charges against District Attorney Winchester Britton, who was removed by Governor Dix. In 1880, he instituted suit, for the first time in the United States, against the vendor of a libel, recovering two judgments, and the Court of Appeals sustained the legal point at issue. In 1885 he organized the National Press Intelligence Company. He is the author of *Personal Recollections of Distinguished Generals* (1865); *A Noble Treason,* a tragedy (1876) and *The Ring Master.*

SHANLY, Walter, Canadian railway engineer and legislator; b. Stradbally, Queen's County, Ireland, Oct. 11, 1819; d. Montreal, Dec. 17, 1899. He studied civil engineering and in 1836 emigrated to Canada. He was resident engineer of the Beauharnois and Welland canals in 1843-1848; of the Northern New York Railroad in 1848–1851; and chief engineer of the Ottawa and Prescott Railway in 1851–1853. In 1853 he became chief engineer of the western division of the Grand Trunk Railroad and he was its general manager in 1857–1862. In 1869–1875 he was engaged in building the Hoosac Mountain Tunnel in Massachusetts, the greatest achievement of his career. He was chief engineer of the Canada Atlantic Railway in 1879–1885, and thereafter was its consulting engineer. He was a member of the Canadian Assembly in 1863–1867, and after the confederation served in the Dominion Parliament in 1867–1872 and in 1885–1891.

SHANNON, shăn'on, **Wilson,** American politician: b. Belmont County, Ohio, Feb. 24, 1802; d. Lawrence, Kans., Aug. 30, 1877. He had a collegiate and law training and began practice at St. Clairsville, Ohio. In 1832 he became attorney for Belmont County, and in 1838 Democratic governor of the state. After the interim of one term he was re-elected in 1842. During 1844–1845, until the suspension of diplomatic relations, he was minister to Mexico by appointment of President Tyler; and after his return he practiced law in Cincinnati. He was elected to Congress in 1852, where he served on the committee on foreign affairs. In 1855 he was appointed by President Pierce to succeed Andrew H. Reeder as governor of Kansas. The contests of the pro- and anti-slavery factions among the people to gain possession of the legislature made the post an exceedingly onerous one, especially for one who endeavored to administer affairs impartially. He resigned in August of the following year. After the political troubles of Kansas had subsided he returned to the state to reside.

SHANNON, a river in Ireland, the largest in the country; rises at the foot of the Cuilcagh Mountains, in the northwest of County Cavan, flows west southwest, through Lough Allen, then takes an irregular course, generally south, to Lough Rea, then southwest to Lough Derg, then south to Limerick where it becomes a tidal stream. From here on to its mouth are several expansions and it enters the ocean by a broad estuary. The various lakes through which it passes are in part real lake basins and partly river expansions. The total length is 254 miles. By means of improvements which cost about $5,000,000, the river has been made navigable from Lough Allen to Limerick, and the Grand and Royal canals, which connect the river with Dublin, have increased its commercial importance. A great hydroelectric development, designed to provide power for a large part of the industries of the republic, was begun in 1925 and was completed in 1929.

SHANNON, The. See CHESAPEAKE AND SHANNON, BATTLE OF.

SHANSI (West of the Taihang Mountains), a province of China, in the loess highlands between the Mongolian steppes and the agricultural regions. Its area is about 60,393 square miles. The Great Wall forms its northern boundary, and it is separated from Shensi, to the west, by the Yellow River, flowing south on the eastern side of its great bend. Shansi's rugged surface contrasts sharply with the level tracts in neighboring Hopei and Honan. Only about 10 per cent of Shansi (in the north, south, and central sections) is level. Except for the Nitao (Nitwo), which flows through Hopei to the sea, Shansi's chief rivers, largely unnavigable, are tributaries of the Yellow River. Taiyuan (Yanku), the capital, and Tatung, an important city in the northern corner, are connected with Peiping by rail. One section of the railway which will connect Tatung with Yungtsi (Puchow), an important city in the southernmost corner, was still uncompleted in May 1947. Shansi does not produce enough grain for its population. The principal grains are wheat, millet, and kaoliang, and there is a great variety of vegetables and quantities of fruits, particularly grapes. Coal deposits in Shansi, estimated at about 36,000,000,000 metric tons (the richest in China) are said to be sufficient to supply China's needs for centuries. Other minerals include iron and copper. Pop. (official est. 1945–1946) 11,601,026.

SHANTUNG, is a northern maritime province of China with an area of 55,560 square miles. Notable in Chinese history as the home of Confucius and Mencius, it is one of China's densely populated regions. The province includes the Shantung Peninsula, opposite Liaotung. These two peninsulas, separated by Tengchow Strait, control the entrance to the Gulf of Pohai. The greater portion of Shantung is level, but its peninsular areas are mountainous, with parts rising over 3,000 feet above sea level. Mainly because of the lack of rivers, there is little alluvial soil along the coast. The shores are generally bold and full of indentations, some of which have good harbors, providing Shantung with some of China's important seaports, including Tsingtao, Chefoo, and Weihaiwei. These ports have a significant chapter in China's for-

eign relations. Chefoo was opened to Western trade as a result of the 1858 treaty with Great Britain, and Weihaiwei and Tsingtao were leased to Great Britain and Germany respectively. Shantung Province is dotted with lakes and intersected by the Yellow and Chiaolai rivers, and the Grand Canal. In 1938 the dike of the Yellow River was cut to stop Japan's drive southward, and the river subsequently changed its course, entering the Yellow Sea from Kiangsu instead of following its old course through Shantung to Pohai. With UNRRA's assistance, plans were made to force the Yellow River back to its former bed in order to reclaim vast agricultural lands. The Tientsin-Pukow Railway runs through the province, and the Kiaochow-Tsinan Railway links Tsingtao and Kiaochow Bay with Tsinan, the capital. Inland navigation is augmented by the Grand Canal, which traverses the western part of the province, affording great trading advantages. Shantung's chief crops are rice, wheat, corn, kaoliang, millet, and peanuts. Coal and iron are important minerals. Although it has never been an industrial center of China, Shantung is known for some of its exports to foreign markets, notably Shantung or pongee silk, and straw braid. Industrial backwardness, population pressure, and natural and human calamities have impoverished the greater proportion of the people.

Shantung became a center of international conflict after Germany forced China in 1898 to lease Kiaochow, including Tsingtao, and to grant railway concessions. About two weeks after the outbreak of World War I, Japan seized Kiaochow and obtained secret agreements from the Allied powers recognizing her claims over Shantung. At the Paris Peace Conference of 1919 the representatives of the powers admitted Japan's claims over German interests in Shantung despite the strong protest of China; hence the Chinese delegation refused to sign the Treaty of Versailles. At the Washington Conference in 1922, Japan agreed to withdraw her troops from Shantung and to return the leased territory of Kiaochow to China. Before 1937, Japan twice sent troops to Shantung, and from 1937 to 1945 occupied it. Not long after Japan's surrender the province became the scene of sanguinary warfare between Nationalist and Communist armies. Tsingtao, the last government stronghold, surrendered to the Communists on June 3, 1949. Pop. (est. 1945–1946) 38,410,867.

SHAPE. See SUPREME HEADQUARTERS, ALLIED POWERS EUROPE.

SHARI (CHARI), a large river in central Africa, which enters the south side of Lake Tchad by several mouths after a course of about 700 miles from the southeast.

SHARKS, an extensive group of elasmobranch fishes of the order Selachii, in which the claspers are complex in structure and the pectoral fins supported on the shoulder-girdle by three basal axial cartilages which may be more or less subdivided, and which bear the cartilaginous fin rays chiefly or exclusively on one side. The external parts of the fins are supported by delicate horn-fibers or actinotrichia. From the rays and skates the sharks are distinguished by the position of the branchial clefts, which are always lateral, by the fan-shaped pectoral fins, and by the shape of the body, which is almost always elongated, rounded and tapering to the strongly heterocercal tail.

The sharks breathe by gill-sacs or pouches, which open externally on the neck by gill-slits, of which there are five to seven pairs. Water may also be admitted to the gills through the spiracles, a pair of openings on the upper side of the head representing an interior pair of gill-slits which are never large and often absent. The mouth exists on the under surface of the head, a conformation compelling some of these fishes to turn on their backs to bite conveniently objects at the surface. The skin is usually provided with small tooth-like granules in the form of placoid scales; and is used under the name of *shagreen,* in the manufacture of various articles, such as purses, spectacle-cases, or as a substitute for sandpaper. The eggs may be laid in capsules or cases of horny material, within which the embryos are protected, the egg-cases being moored or fastened by filaments to rocks or fixed objects, and the young form escaping in due time from its covering. The egg-cases of dog-fishes are frequently cast up on the shores, and receive the fanciful or popular name of "mermaids'-purses," "sea-purses," and the like. The majority of the sharks are, however, viviparous and in some the embryos are nourished by means of placenta-like structures. The skeleton never attains a high degree of perfection, but is chiefly cartilaginous. The skull exhibits no indications of divisions into distinct cranial bones, although the jaws are well developed and calcified. The intestine is provided with a spiral valve which serves to increase the area over which the food has to pass, and the base of the aorta contains rows of valves.

The species of sharks are numerous and so varied in structure that the living forms alone have been arranged in about 20 families. With the single exception of *Eulamia nicaraguensis,* which inhabits Lake Nicaragua, all are marine, only a few occasionally entering the large rivers of India. Owing to their active, roving habits, most of them are widely distributed. With perhaps half a dozen exceptions all sharks are strictly carnivorous and predaceous, and because of their ferocity several of the large species are justly feared.

Species of Sharks.—The white shark or man-eater (*Carcharodon carcharias*) is white below and brown on the upper parts. It is probably the best known of the sharks, and is found in most seas. (See MAN-EATER). The blue shark (*Carcharinus glaucus*), also known as man-eater, is slaty-blue on the upper, and white on the under parts. It may attain a length of 20 feet or more, and is exceedingly destructive to shoals of food-fishes, pursuing its prey even into the fishermen's nets. Both of these occur occasionally on our coasts, where the dusky shark (*C. obscurus*) closely related to the last, but smaller, is very common. The thresher shark (*Alopias vulpes*), is known by the exceedingly elongated upper tail-lobe, which the fish uses after the fashion of a powerful flail when it attacks a school of fish. It feeds chiefly on fishes, and occasionally visits our coasts. The average length varies from 12 to 15 feet. A very common small species along the Atlantic coast is the sand shark (*Carcharias littoralis*), which has very acute teeth mostly provided at the base with one or two cusps. The

hammer-headed shark (q.v.) is at once recognized by the lateral elongation of the head to form a hammer-like structure. The porbeagle shark (*Lamna cornubica*) may attain a length of six feet, and is grayish-black. It has slender, very acute teeth and is quite a common visitor to our coasts, where it is also known as the mackerel-shark. The basking-shark (*Cetorhinus maximus*) attains a length of from 30 to 36 feet, being the largest of all sharks, and is found around our coasts but is chiefly an Arctic species. The name is derived from its habit of lying motionless on the surface of the water in the sun, often in schools. It is sluggish and, in spite of its huge size, harmless and feeds on fish. The head and teeth are small, the dorsal fin very large and the gill-slits long. The Greenland, northern, or sleeper shark (*Somniosus microcephalus*) attains a length of 18 feet, and is brown, shaded with deep blue. It feeds upon the carcasses of whales, even attacks living whales, and is chiefly found in the Arctic seas. The spinous shark (*Echinorhinus spinosus*) is so named from the presence of the spiny scales scattered over its integument. The average length is seven or eight feet. It is common on the Atlantic coasts of Europe and Africa, and has been taken once on Cape Cod.

Of the dog-fishes (q.v.) may be mentioned the smooth dog (*Galeus canis*), and the picked dog-fish (*Squalus acanthias*). Two very remarkable sharks representing groups now nearly extinct are the Port Jackson shark (see Cestracion) and the frilled shark (*Chlamydoselache anguineus*). The former is remarkable for the pavement-like teeth and stout fin-spines and the latter for its eel-shaped body, diphycercal tail, frilled gill-clefts and prominently lobed teeth. The former occurs in Australian, the latter in Japanese waters. Another very recent discovery in the latter region is *Mitsukurina owstoni*, unique among living sharks in its prolonged snout and protruding mouth. The sawsharks (*Pristiophoridae*), which bear a doubly serrate process on the snout like the sawfishes (q.v.), are otherwise shark-like; and the angel-sharks (*Squatinidae*), with much flattened bodies, lead to the skates and rays.

The varieties of extinct sharks are still more numerous and vary from the delicate little acanthodians, only a few inches long, of the Carboniferous, to the huge Tertiary carcharodons, whose five-inch teeth indicate a length of 75 feet. Many of the Palaeozoic sharks were of types very different from any now living.

Usefulness.—The liver of some sharks contains a large quantity of oil, and they are accordingly caught in great numbers in some places, and the oil extracted. Shark-fishing constitutes an industry of some importance on the coast of Russian Lapland and the northern portion of Norway. Those caught here are chiefly the basking shark and the Greenland shark. The Norwegians employ decked vessels of 20 to 30 tons burden, which carry on the fishery as much as 100 or 150 miles from land, at depths of 250 to 300 fathoms. These vessels carry five or six men. On the coast of Norway, farther to the south, other species of sharks are also caught. In order to attract the sharks the fishermen take an old barrel pierced with several holes, pour oil or grease into it and sink it to the bottom with stones. The oil or grease escapes slowly, and is carried by the currents to a distance, thus attracting the keen-scented fishes to the place where the boat is stationed. Here they are caught by hooks baited with salted seal's flesh and fastened to the end of strong chains. When a shark is hooked three of the men haul in the chain, while a fourth stands ready with a mallet, weighing about 20 pounds, to stun the fish when its head appears.

The fisheries of China, India and Africa, which have for their object the white shark and other large species for the purpose of supplying the sharks-fin trade of China, are also of great value, and capture annually a total of not less than 100,000 sharks. In the United States shark fisheries have never been developed extensively, practically the only one worthy of mention being the dogfish industry of New England and particularly of Maine, where the livers of the spiny or picked dogfish are tried for oil and the flesh ground into a poultry food. Dogfish oil is used by curriers and as an adulterant of cod-liver oil. In Europe the dogfish fisheries are far more extensive and, besides the oil secured from the livers, the flesh yields an extract which for nutritive properties compares favorably with extract of beef, and is generally edible and likable.

SHARON, shār'ŏn, Pa., city in Mercer County, alt. 850 feet; on the Shenango River and the Erie and the Pennsylvania railroads, 76m. SW. of Erie; with freight service on the New York Central and the Pittsburgh and Lake Erie railroads. Principal industries are steel production, railroad equipment, heavy transformers and electrical equipment, pipe and tube mills. Among its manufactures are automobile lubricants, railroad tank cars, track door hinges, hardware, gas station equipment, and electric transformers. Sharon's public library is stocked with more than 25,000 volumes. By way of cultural organizations, there are the Sharon Players, the Shenango Valley Theater Guild, and the Shenango Valley Symphony. Sharon might be called the capital of the Shenango Valley, as it is a leader among a number of communities with common interests and a marked spirit of civic union. Within a 10-mile radius from the center of Sharon is a population of more than 150,000, sharing cooperatively in community welfare funds, hospital upkeep and benefits, recreational facilities, and the like.

Founded in 1795, Sharon became a borough in 1841; a city in 1918. Pop. (1950) 26,454.

SHARON, Palestine, in biblical geography a plain on the Mediterranean coast of the country, reaching inland to the hills and from Joppa to Caesarea. It was originally of great fertility, with forests and rich vegetation, and is still excellent pasture ground. The beauty

of the district was generally recognized (Isaiah 35:2), and its roses in the Song of Solomon (2:1). The herds of David are mentioned as grazing there (1 Chron. 27:29).

SHARON SPRINGS, village, New York, in Schoharie County 50 miles west of Albany at an altitude of 1,320 feet. It is on modern highways, has freight service via Delaware and Hudson Railroad, and passenger connection with the New York Central at Fort Plain. Its picturesque location and its mineral springs make it a summer resort and watering place. Pop. (1950) 361.

SHARP, Abraham, English mathematician: b. Little Horton, 1651; d. Yorkshire, July 15, 1742. Having studied and taught mathematics in Liverpool, he was employed by John Flamsteed in the Greenwich Observatory and made for him, in 1688–1689, Flamsteed's first successful instrument, a mural arc. Afterward he taught mathematics in London and subsequently retired to Little Horton, where he devoted himself to mathematics and to making astronomical and calculation instruments, and is said to have been the first Englishman to make these accurately. He published a book of logarithms, the first of its kind, was a joint author with Crosthwait of *The British Catalogue* and plotted a number of important astronomical maps.

SHARP, Cecil James, English musician and music anthologist: b. London, Nov. 22, 1859; d. Hampstead, June 23, 1924. A graduate of Clare College, Cambridge, during a decade in Australia he was assistant organist of the Adelaide cathedral, conductor of the Philharmonic Society, and co-director of the Adelaide College of Music. He also composed two light operas and several smaller pieces. Returning to England in 1892, he soon became a power in the musical world and an eminent authority on folk songs. *Folk-Songs from Somerset* in five series (1904–1909) is one of his anthologies. His discovery of 5,000 tunes and variants of early 18th-century songs in remote coves of the Appalachian Mountains (1916–1918) was epochal. In 1911 he founded the English Folk-Dance Society.

SHARP, Dallas Lore, American educator: b. Haleyville, N. J., Dec. 13, 1870; d. Nov. 29, 1929; he was graduated from Brown University, 1895, from Boston University Theological School, 1899, and ordained to the Methodist Episcopal ministry, 1895. Joining the staff of Boston University in 1899, he became professor of English there in 1909. His published works include *Wild Life Near Home* (1901); *Roof and Meadow* (1904); *The Lay of the Land* (1908); *The Fall of the Year* (1911); *Winter* (1912); *Where Rolls the Oregon* (1914); *The Hills of Hingham* (1916); *The Seer of Slabsides* (1921); *Highlands and Hollows* (1923); *The Spirit of the Hive* (1925); *The Better Country* (1928).

SHARP, Granville, English abolitionist: b. Durham, Nov. 10, 1735; d. London, July 6, 1813. He studied law, but abandoned it to accept a place in the ordnance office. He was the patron of the slave Somerset, whom he found in the streets of London in 1769, having been turned away by his master because of illness. Sharp placed him in a hospital, and on his recovery procured employment for him. Two years later Somerset was claimed by his master, arrested and imprisoned, whereupon Sharp summoned them both before the lord mayor, who discharged the slave. The master still refusing to release him, Sharp brought the case before the court of the King's Bench, which resulted in the famous decision against the legality of slavery in England in 1772.

In 1777 Sharp resigned from the ordnance office because of his disapproval of the American War, and devoted himself thereafter to philanthropy, particularly to the overthrow of slavery. He was chairman of the meeting which in 1787 formed the Association for the Abolition of Slavery and was one of the founders of the Negro colony at Sierra Leone. He was also an advocate of parliamentary reform, opposed dueling and favored the extension of privileges to Ireland. He wrote 61 pamphlets in reference to the causes to which he devoted his life, among which are *Representation of the Dangerous Tendency of Tolerating Slavery in England* (1772), and *Account of the English Polity of Congregational Courts* (1786).

SHARP, James, Scottish ecclesiastic: b. Castle of Banff, May 4, 1613; d. Magus Muir, Saint Andrews, May 3, 1679. He was educated at the University of Aberdeen and was appointed regent there, where his conduct won him the friendship of the clergy. He held a professorship in Saint Leonard's College, Saint Andrews, and was then appointed minister at Crail, Fifeshire. In 1656 he was a representative from the Presbytery to Cromwell, and he managed this mission so well that he was sent in 1660 to Monk and to Charles II. He treacherously agreed to help Monk restore Episcopacy in Scotland, but the time for this coup not being ripe he played the double part of friend to his constituents in Scotland and tool of General Monk in England.

When Parliament established Episcopacy in 1661 Sharp benefited from both parties, being appointed professor of theology in Saint Mary's College, Saint Andrews and king's chaplain for Scotland. He now completely went over to the king's party, was consecrated archbishop of Saint Andrews and primate of Scotland. In 1663 he secured the establishment of a high court commission, in which he took precedence of the chancellor, and the odious persecutions of the Resolutioners by this court, especially the cruelties it inflicted after the uprising in Pentland, made Sharp an object of intense hatred throughout the country, a hatred shared by the king and court, whose tool he was regarded. Falling by accident into the hands of a party of his enemies in 1679, he was dragged from the coach in which he was riding with his daughter and was beaten to death.

Consult Stephen, Thomas, *Life and Times of Archbishop Sharp* (London 1839); Dodds, James, *Fifty Years' Struggle of the Scottish Covenant* (London 1860); *The Lauderdale Papers* (Camden Society Publications, London 1885).

SHARP, William, Scottish writer: b. Paisley, Sept. 12, 1855; d. Sicily, Dec. 14, 1905. He was educated at the University of Glasgow, after which he made a voyage to Australia. In 1879 he settled in London. Among his works is a collection made with the assistance of his wife called *Lyra Celtica*. In verse he published

The Human Inheritance (1882); *Earth's Voices* (1884; *Romantic Ballads and Poems of Fantasy* (1886); *Sospiri d'Italia* (1904). His fiction includes *Children of Tomorrow* (1890); *Silence Farm* (1899). He wrote, also, the biographies of Shelley, Heine and Browning and *Literary Essays; Greek Studies* (1903–1904). Two volumes of his critical work appeared in 1912 and in 1909–1911 appeared a complete edition of his works, 7 vols. See also MACLEOD, FIONA.

SHARP, William Graves, American diplomat: b. Mt. Gilead, O., March 14, 1859; d. Nov. 17, 1922. He graduated from the law school of the University of Michigan in 1881, and for a time practised law. He then went into the iron and chemical business, in which he accumulated a large fortune. He was three times elected to Congress, beginning in 1908. In 1914 he was appointed by President .Wilson ambassador to France, and held that office during the World War I.

SHARP-SHIN, a small hen-hawk (q.v.).

SHARP-SHOOTERS, the name formerly given to the best shots of a company, who were armed with rifles and took aim in firing. They are superseded by the better arms and more complete organization of modern armies. According to the United States army regulations, a sharpshooter is a grade of rifleman next below that of expert rifleman. He wears a silver badge, consisting of a pin and cross, on the left breast of the coat.

SHARP-TAILED GROUSE, the northern prairie-chicken (q.v.), a grouse (*Pedioecetes phasianellus*), which has the general habits of the pinnated grouse, but differs among other features in lacking the neck-tufts, in the characteristic form of the tail, in which the central pair of quills are soft, parallel-edged and square-tipped, projecting an inch or two beyond the next pair. It is somewhat more fond of brushy places and flies more than does the pinnated grouse.

SHARPE, Henry Granville, American soldier: b. Kingston, N. Y., April 30, 1858, d. Providence, R. I., July 13, 1947. He was graduated from the United States Military Academy in 1880, and appointed a second lieutenant in the Fourth Infantry, but resigned from the army in 1882. In 1883 he re-entered the service as a captain on the staff of the commissary department. He was promoted through the grades to brigadier general, commissary general, 1905; brigadier general, Quartermaster Corps, 1912; major general, quartermaster general, 1916, and major general in the line, 1918. He retired May 1, 1920. He was chief commissary at Camp George H. Thomas, Georgia, 1898; and chief commissary of the Division of the Philippines, 1902–1904 and served in France in 1918–1919. He published *The Art of Subsisting Armies in War; The Art of Supplying Armies in the Field as Exemplified During the Civil War; The Provisioning of the Modern Army in the Field; The Quartermaster Corps in the Year 1917 in the World War* (1921).

SHARPE, Samuel, English Egyptologist: b. London, March 8, 1799; d. there, July 28, 1881. He published *The Early History of Egypt* (1836); *Egyptian Inscriptions* (1837); *Vocabulary of Egyptian Hieroglyphics* (1837); *The History of Egypt Under the Ptolomies* (1838); *The New Testament Translated* (1840); *The History of Egypt from the Earliest Times till* A.D. *640* (1846); *The Hebrew Scriptures Translated* (1865).

SHARPLES, James, American artist: b. England, 1751; d. New York, Feb. 26, 1811. He began his artistic career in the United States in 1794 with a series of pastel portraits for which some of the most eminent men of the day gave him sittings, and there are still extant by him portraits of Washington, Jefferson, Hamilton, Monroe, De Witt Clinton, and Burr. These are treasured in the National Museum at Philadelphia, where they were placed, 40 in all, in 1876. He was also interested in mechanics and in the first volume of the *Medical and Philosophical Register* (1811) is a paper by him on steam carriages. He is buried in the churchyard of Saint Peter's, Barclay Street, New York.

SHARPLESS, Isaac, American educator: b. Chester County, Pa., Dec. 16, 1848; d. Jan. 16, 1920. He was graduated from the Lawrence Scientific School, Harvard, in 1873, was instructor in mathematics at Haverford College in 1875–1879, occupied the chair of mathematics and astronomy there in 1879–1885, was dean in 1885–1887 after which he was president of the college. He wrote textbooks of astronomy and geometry and also published *English Education* (1892); *A Quaker Experiment in Government* (1898); *Two Centuries of Pennsylvania History* (1900); *The American College* (1915).

SHARPS, Christian, American inventor: b. New Jersey, 1811; d. Vernon, Conn., March 13, 1874. He developed a taste for mechanics at an early age and practically devoted his life to invention. He was the originator of many ingenious implements, but none of these gave him such fame and remuneration as the breech-loading rifle which bears his name. In 1854 he removed to Hartford, Conn., to superintend the manufacture of this rifle, and he subsequently invented other firearms of great value and patented many ingenious implements of various kinds.

SHARPSBURG, Md., a town in Washington County; altitude 425 feet; beautifully situated in a narrow valley, 12 miles south of Hagerstown, about the same distance north of Harper's Ferry. It was founded in 1763 and named for Gov. Horatio Sharpe. It has no manufactures, but is surrounded by a fine farming country, the chief products of which are corn, wheat, hay, apples, peaches and other fruits. It is chiefly noted as the scene of the Battle of Antietam (q.v.) or Sharpsburg, fought on the outskirts of the village, Sept. 17, 1862, in which more men were killed and wounded than on any other day of the Civil War. Pop. (1940) 834; (1950) 866.

SHARPSBURG, Pa., borough in Allegheny County; altitude 741 feet; on the Allegheny River; served by the Pennsylvania Railroad; 5 miles northeast of Pittsburgh. It was founded in 1826 by James Sharp; incorporated as a borough

in 1841. It is in a coal-mining region. The chief industrial establishments are foundries, steel plants, machine shops, bottle works, planing mill, brewery, and a large railroad classification yard. Other manufactures are blow torches, hardware, welding equipment, grease, beverages, cement and compounds. It exports annually large quantities of its manufactured products. It has two high schools, public and parish elementary schools, and a public library. Pop. (1950) 7,296.

SHARPSBURG (Md.), **Battle of.** See ANTIETAM, THE BATTLE OF.

SHARPSHOOTER, shärp'shōōt-ẽr, popular name in southern United States for any of several hemipterous insects which puncture the immature cotton bolls, causing them to wilt or rot. Of these the *Homalodisca coagulata* is the most common. The Mexican boll weevil is likewise known by the name in some parts of Texas.

SHARSWOOD, shärz'wŭd, **George,** American jurist: b. Philadelphia, Pa., July 7, 1810; d. there, May 28, 1883. He was graduated at the University of Pennsylvania in 1828, and was admitted to the bar in 1831. He served in the state legislature in 1837–1838 and in 1842–1843, and in 1845 was appointed judge of the District Court of Philadelphia, becoming president of that court in 1848. In 1848 he was appointed to the bench of the Supreme Court of Pennsylvania, of which he was chief justice from 1878 until he retired in 1882. He ranked as one of the most eminent jurists in the state. From 1843 to 1846 he edited the *American Law Magazine.* He was professor of law at the University of Pennsylvania in 1850–1867. He brought out editions of many English law textbooks, of which the most famous was *Sharswood's Blackstone's Commentaries* (1859). He was author of *Professional Ethics* (1854); *Lectures Introductory to the Study of the Law* (1870).

SHASTA, Mount, a peak of the Sierra Nevada range in Siskiyou County in California. It is of volcanic origin, about 14,162 feet above sea level, and on its summit are five glaciers, one of which, Whitney, is three miles long. On the slope and near the base are large trees, some 300 feet high. The mountain is conical in form and has been a dormant volcano for a long period. It was discovered in 1827 by P. S. Ogden, and scaled in 1854 by E. D. Pearce.

SHASTA INDIANS, shăs'tà, probably from *tsasdi,* "three," referring to a triple-peak mountain. A group of small tribes forming the Shastean linguistic stock of American Indians, formerly occupying the territory drained by Klamath River and its tributaries from the western base of the Cascade Range to the point where the Klamath flows through a ridge of hills east of Happy Camp, in northern California and extending over the Siskiyou Mountains in Oregon as far as the confluence of Stewart and Rogue Rivers. They have practically lost their native customs through contact with civilization, but they were a sedentary people, living in rectangular, semi-subterranean plank houses, and subsisting chiefly on salmon and other fish, acorns, roots and seeds. They made basket caps (which the women wore), as well as small food baskets and a rude form of dug-out canoe. They rapidly succumbed to the encroachments of civilization, and while the tribes composing the stock were never populous, their total number at present is about 1,000, most of whom are on the Siletz Reservation in Oregon. Mount Shasta derives its name from these Indians.

Consult Dixon, R. B., "The Shasta," in American Museum of Natural History *Bulletin,* vol. 17 (New York 1907); Kroeber, A. L., *Handbook of Indians of California,* Bulletin 78, Bureau of American Ethnology (Washington 1925).

SHATTUCK, shăt'ŭk, **Frederick Cheever,** American physician, brother of G. B. Shattuck; b. Boston, Mass., Nov. 1, 1847; d. Jan. 11, 1929. He was graduated at Harvard University in 1868 and took his M.D. there in 1873. He engaged in practice in Boston in 1875, was connected with the faculty at Harvard from 1879, and from 1888 he was Jackson professor of clinical medicine there. He became professor emeritus in 1912, at the same time retiring from practice. He became an overseer of Harvard in 1913 and was a retired lieutenant in the United States Army Medical Reserve Corps. He was the author of many papers in medical journals.

SHATTUCK, George Brune, American physician: b. Boston, Mass., Aug. 18, 1844; d. there, March 12, 1923. He was graduated at Harvard in 1863 and took his M.D. there in 1869. He was engaged in practice in Boston in 1869–1911, when he retired. He edited the *Boston Medical and Surgical Journal* in 1881–1911. At the time of his retirement he was senior physician to the Boston City Hospital. He was an overseer of Harvard in 1890–1901 and in 1903–1912.

SHATTUCK SCHOOL, The, a noted college preparatory school at Faribault, Minn., about 50 miles south of Minneapolis. The school, organized in 1865, owes its existence to the efforts of the Rt. Rev. Henry Benjamin Whipple, who, very soon after his consecration in 1859 as the first Protestant Episcopal bishop of Minnesota, organized at Faribault the Bishop Seabury Mission, out of which grew the Cathedral of our Merciful Saviour, the Seabury Divinity School, Saint Mary's Hall (school for girls), and the Shattuck School for boys, all widely known. The basis of the mission was a small school which had been established at Faribault in 1858 by the Rev. James L. Breck. Shattuck School was named for Dr. George Cheyne Shattuck, of Boston, Mass., one of its earliest benefactors, who also founded St. Paul's School, at Concord, N. H. The school has trained more than 3,000 boys. Average attendance is about 250, these being drawn largely from well-to-do families of the northwest. Military training is compulsory.

SHAUGHNESSY, Thomas George, 1ST BARON SHAUGHNESSY OF MONTREAL, Canadian railway president: b. Milwaukee, Wis., Oct. 6, 1853; d. Montreal, Canada, Dec. 10, 1923. In 1868–1882 he was connected with the Milwaukee and Saint Paul and the Chicago, Milwaukee and Saint Paul railroads, in which time he gained a mastery of railroad management. He became purchasing agent of the Canadian Pacific Railway in 1882, later was assistant general manager and president of the Canadian Pacific Railway and all its associated companies. He accomplished an important share in the development of Canada and his services were recognized by a knight-

hood in 1901, while in 1916 he was created Baron Shaughnessy of Montreal.

SHAW, shô, **Albert,** American editor and political economist: b. Shandon, Butler County, Ohio, July 23, 1857; d. New York City, June 25, 1947. He was graduated from Iowa College, Grinnell, Iowa, in 1879, took a post-graduate course in constitutional history and economic science there, and in 1881 began a course in history and political science at Johns Hokpins, taking the degree of Ph.D. in 1884. In 1883–1888 and again in 1889–1890 he was on the editorial staff of the Minneapolis *Tribune,* in 1888–1889 he studied in Europe and in 1891 established the *American Review of Reviews,* which he edited until 1937. In 1884 he published *Icaria, a Chapter in the History of Communism,* which was translated into German. His other works include *Co-operation in the Northwest* (1883); *Local Government in Illinois* (1883); *Municipal Government in Great Britain* (1895), and *Municipal Governmental in Continental Europe* (1895). The last two mentioned gave him a recognized standing as an authority on questions of municipal government. Other works are *The Business Career in its Public Relations* (1905); *Political Problems of American Development* (1907); *The Outlook of the Average Man* (1907); *Cartoon History of Roosevelt's Career* (1910), and *Abraham Lincoln,* 2 vols. (1929).

SHAW, Anna Howard, American woman suffrage leader, minister and physician: b. Newcastle-upon-Tyne, England, Feb. 14, 1847; d. Moylan, Pa., July 2, 1919. She came to the United States at the age of four, studied at Albion College, Michigan in 1873–1876, was graduated at the Boston University of Theology in 1878 and took her M.D. at Boston University in 1885. She was granted a local preacher's license by the district conference of the Methodist Episcopal Church, and paid the expenses of her education by preaching and lecturing. She was pastor of the Methodist Episcopal Church at Hingham, Mass., in 1878, and at East Dennis in 1878–1885. She was, however, refused ordination by the New England Conference because of her sex, and the decision was confirmed by the General Conference at Cincinnati in 1880. She was ordained in the Protestant Methodist Church Oct. 12, 1880, the first woman ordained by that denomination. In 1885 she resigned her pulpit to lecture for the Massachusetts Woman Suffrage Association. She was national superintendent of franchise for the Women's Christian Temperance Union in 1886–1892; and in her connection with the National American Woman Suffrage Association she was national lecturer in 1886–1904; vice president at large in 1892–1904; president in 1904–1915; and thereafter was honorary president. To her courage, initiative, resourcefulness and sound reasoning may be credited much of the success of the woman suffrage movement, the constitutional amendment for which was passed by Congress shortly before her death. She was in her lifetime the recipient of world-wide honors, had spoken in every state in the Union, as well as being the first woman to speak in Gustav Vasa Cathedral, and the State Church of Sweden. She was the first ordained woman to preach at the universities of Copenhagen, Berlin, Christiania, London, and Amsterdam. She was chairman of the Women's Committee of the Council of National Defense from 1917, and received the distinguished service cross for her services in World War I.

SHAW, George Bernard (bûr'nĕrd), Irish-born journalist, critic, and dramatist: b. Dublin, July 26, 1856; d. Ayot St. Lawrence, Herts, England, Nov. 2, 1950. He went to London in 1876. Between 1879 and 1883 he wrote five novels entitled: *Immaturity; The Irrational Knot; Love Among the Artists; Cashel Byron's Profession; An Unsocial Socialist. Immaturity* remained in manuscript until its publication in 1930 in the collected edition of Shaw's works. The other four were first published serially in *To-day* and *Our Corner* between 1884 and 1888. Meanwhile, Shaw had become converted to socialism by hearing Henry George and by reading Karl Marx. He joined the Fabian Society in 1884 and shortly after became a leader in the organization. In 1889 he edited *Fabian Essays in Socialism* and contributed "The Basis of Socialism" and "The Transition to Social Democracy" to the volume. From 1886 to 1898 he made a precarious living as a journalist; in 1886–1887 as art critic to the *World,* in 1888–1890 as music critic to the *Star,* under the signature of Corno di Bassetto; in 1890–1894 as music critic to the *World;* and in 1895–1898 as dramatic critic to the *Saturday Review,* where the arresting reviews signed G.B.S. introduced him to the world of the theater. In 1891 he first showed his interest in the new drama by publishing *The Quintessence of Ibsenism.* In 1892 his first play, *Widower's Houses* was produced at J. T. Grein's Independent Theatre. Thereafter, he began playwriting in earnest. When most of his early plays found only brief or sporadic production, he decided to offer them to the reading public instead. In 1898 he published in two volumes *Plays: Pleasant and Unpleasant.* In the *Pleasant* volume were *Arms and the Man; Candida* (q.v.); *The Man of Destiny;* and *You Never Can Tell;* in the *Unpleasant* volume were *Widower's Houses; Mrs. Warren's Profession;* and *The Philanderer.* Also in 1898 appeared his study of Wagnerian music, *The Perfect Wagnerite.* In 1900 came *Three Plays for Puritans* containing *The Devil's Disciple,* which had been successfully produced by Richard Mansfield in New York in 1897, *Caesar and Cleopatra;* and *Captain Brassbound's Conversion.* In 1903 he published *Man and Superman* (q.v.) With this play Shaw's playwriting technique became more discursive and with a few brilliant exceptions discursiveness remained thereafter the most characteristic phase of Shavian dramaturgy, and also the least acceptable in the theater. Between 1904 and 1907 (under the management of J. E. Vedrenne and H. Granville Barker at the Court Theatre) Shaw's plays won a firm place in the theatrical world. At the same time he was being given a hearing in America through the efforts of Arnold Daly. Play after play now followed in rapid succession: *John Bull's Other Island* (1904); *How He Lied to Her Husband* (1904); *Major Barbara* (1905); *The Doctor's Dilemma* (1906); *Getting Married* (1908); *The Shewing-Up of Blanco Posnet* (1909); *Misalliance* (1910); *The Dark Lady of the Sonnets* (1910); *Fanny's First Play* (1911); *Androcles and the Lion* (1912); *Overruled* (1912); *Pygmalion* (1913); and *Great Catherine* (1913). During World War I Shaw's playwriting activity was confined to short plays: *O'Flaherty, V. C.; The*

Inca of Perusalem; and *Augustus Does His Bit.* Late in the war he was engaged in writing *Heartbreak House,* which was published in 1919 and first produced by the Theatre Guild in New York in 1920. The unwieldly pentateuch (cycle of five plays) *Back to Methuselah* (1921) was first performed in New York in 1922 as was his chronicle play *Saint Joan* in 1923. Between 1923 and 1929 there were no new plays, but in 1929, at the age of seventy-three, Shaw made an arrangement with Barry Jackson for the performance of his new and old plays at the Malvern Festival, which was inaugurated that summer. Between 1929 and 1939 the new plays were: *The Apple Cart* (1929); *Too True To Be Good* (1931); *On the Rocks* (1933); *The Simpleton of the Unexpected Isles* (1935); *The Millionairess* (1936); *Geneva* (1938); and *In Good King Charles's Golden Days* (1939). After a lapse of ten years another and perhaps final play, *Buoyant Billions* was produced at Malvern in the summer of 1949.

As a playwright Shaw has taken as his medium the drama of ideas. Within that framework he has presented his radical thinking on most phases of human interest in the fields of economics, politics, sociology, education, philosophy, religion, and art. His most enduring gift to drama has been his talent for comedy. This is to be found in his brilliant, witty style, often satiric or ironic; in his sense of anticlimax; in his cleverness in inventing comic situations; and in his creation of many delightfully comic, though often farcical, characters.

Although Shaw's eventual reputation probably will be determined by his work as a dramatist, he himself has always valued chiefly his contributions to social thinking. His chief publications in this field include: *Commonsense of Municipal Trading* (1904); *Commonsense About the War* (1914); *The Intelligent Woman's Guide to Socialism* (1928); *What I Really Wrote About the War* (1931); *Doctors' Delusions, Crude Criminology,* and *Sham Education* (1932); *The Political Madhouse in America and Nearer Home* (1933); *William Morris as I Knew Him* (1936); *Everybody's Political What's What?* (1944).

Shaw has maintained a voluminous correspondence throughout his life. His private letters display the same brilliance of style found in his plays and prefaces. Many of his letters have already been published, most notably those to Ellen Terry under the title *Ellen Terry and Bernard Shaw, A Correspondence* (1931). Other letters in considerable number are to be found in *Florence Farr, Bernard Shaw, and W. B. Yeats* (1941); Mrs. Patrick Campbell, *My Life and Some Letters* (1922); Doris Arthur Jones, *Taking the Curtain Call* (1930); Lillah McCarthy, *Myself and My Friends* (1933); and in the biographies of Shaw by Henderson and Pearson.

The works of Shaw were published in a limited collected edition in 1930, and beginning in 1931 in a standard edition. This includes his novels, his plays, and his essays and criticism. In England *The Complete Plays of Bernard Shaw* (now incomplete) was published in one volume in 1931, and in 1934 *Prefaces by Bernard Shaw,* also in one volume. The most important critical and biographical treatises on Shaw are the following: P. P. Howe, *Bernard Shaw: A Critical Study* (1915); Archibald Henderson, *Bernard Shaw: Playboy and Prophet* (1932); Hesketh Pearson, *G. B. S. A Full Length Portrait* (1942); *G. B. S. 90,* ed. S. Winsten (1946).

Arthur F. White,
Associate Professor of English, Western Reserve University.

SHAW, Henry Wheeler, known as Josh Billings, American humorist: b. Lanesboro, Mass., April 21, 1818; d. Monterey, Calif., Oct. 14, 1885. He entered Hamilton College in 1832, but remained only one year. He then went to the West to pursue a number of occupations offered by the primitive frontier life, but returned to the East in 1858, and became an auctioneer at Poughkeepsie. He contributed humorous articles to a local paper under the signature of "Josh Billings," but his writings failed to attract much attention until he employed a style of phonetic spelling resembling his homely method of pronunciation. His first book, *Josh Billings, His Sayings* (1865), had an enormous success. For many years he contributed to the *New York Weekly.* His most successful literary venture was a travesty on the *Old Farmer's Almanac,* published for many years by the Thomas family, *Josh Billings' Farmers' Allminax.* Over 200,000 copies were sold within two years of its appearance in 1870. In 1863 he began to give public lectures, which consisted of detached bits of homely philosophy, usually pointing a moral. The delivery having an inimitable strain of drollery made him a great popular success. He published *Everybody's Friend* (1874); *Josh Billings, His Works Complete* (1876); *Josh Billings' Trump Kards* (1877); *Josh Billings' Spice Box* (1881).

SHAW, Lemuel, American jurist: b. Barnstable, Mass., Jan. 9, 1781; d. Boston, Mass., March 30, 1861. He was graduated at Harvard University in 1800 and became prominent in the practice of law in Boston. He sat in the Massachusetts house of representatives and senate, 1811–1816 and in 1819, and in the state senate 1821–1822 and 1828–1829, and was a member of the State Constitutional Convention of 1820. As chief justice of the Massachusetts Supreme Court, 1830–1860, he won a high reputation as a jurist. He was a fellow of the American Academy of Arts and Sciences; a member of the Massachusetts and New England Historical Societies and of various local clubs, and a trustee of the Boston Library and Humane societies. He translated from the French the *Civil and Military Transactions of Bonaparte.*

SHAW, Leslie Mortier, American lawyer: b. Morristown, Vt., Nov. 2, 1848; d. March 28, 1932. He was graduated from Cornell College, Mount Vernon, Iowa, in 1874, and from the Iowa College of Law in 1876; was admitted to the bar and established a law practice in Denison, Iowa. He was also prominent in local financial circles and became president of the bank of Denison, and of the bank of Manilla, Iowa. He occasionally took part in the campaign work of the Republican Party, but did not become prominent until the campaign of 1896, when his strong advocacy of the gold standard, his skillful handling of statistics and keen arguments in public speaking won him a wide reputation, and he was called upon to speak in many different sections of the country. His effective work on the Republican side in the free silver campaign of 1896, speaking an average of from five to seven hours daily, led to his

nomination and election the following year as governor of Iowa. He was re-elected two years later, doubling his plurality and multiplying his majority by four. He declined a third nomination. In 1898 he was president of the International Monetary Congress at Indianapolis. At the end of his second term as governor he became secretary of the treasury in President Theodore Roosevelt's cabinet and held that position a little over five years. He resigned in 1902 and was engaged in banking in New York and Philadelphia until 1913 when he retired.

SHAW, Richard Norman, British architect: b. Edinburgh, Scotland, May 7, 1831; d. Hampstead, England, Nov. 7, 1912. Shaw is best known for the revolution he led in domestic architecture when he broke away from the Victorian "Gothic" and designed houses in the Queen Anne and Georgian styles, using the traditional red brick, with tiled roofs. His country and London houses in the grand manner had great charm, and his economical small houses, designed in the late 1870's, were copied throughout England. In 1877 he was elected to the Royal Academy. At 23 he had received a traveling scholarship from it—after seven years' apprenticeship to a London architect. His travels bore fruit in his *Architectural Sketches from the Continent* (1858). In 1891, with Thomas G. Jackson as joint editor, he published *Architecture, a Profession or an Art?*

SHAW, Robert Gould, American soldier: b. Boston, Mass., Oct. 10, 1837; d. Fort Wagner, Charleston Harbor, S. C., July 18, 1863. He studied at Harvard, entered a New York business office, enlisted in the 7th New York Regiment at the outbreak of the Civil War, and was promoted captain (1862). In 1863 he was made colonel of the 54th Massachusetts Volunteers, the first Negro regiment sent from the free states. The regiment left Boston for the front May 28, acquitted itself satisfactorily in a skirmish on James Island, near Charleston, S. C., July 16, and on July 18 participated with distinction in the desperate attack on Fort Wagner. Shaw was killed while leading his troops. The well-known Shaw memorial by Augustus Saint-Gaudens was placed in 1897 on Boston Common.

Consult Higginson, Thomas W., ed., *Harvard Memorial Biographies,* vol. 2 (Cambridge, Mass., 1866); Teamoh, Robert T., *Sketch of the Life and Death of Col. Robert Gould Shaw* (Boston 1904).

SHAW, Sir **William Napier,** English physicist: b. Birmingham, England, March 4, 1854; d. London, March 24, 1945. He was educated at Emmanuel College, Cambridge, and at the University of Berlin, was elected fellow of Emmanuel College (1877) and was senior tutor there (1890–1899). From 1897 to 1905 he was a member of the Meteorological Council and in the latter year became director of the Meteorological Office. From 1920 to 1924 he was professor of meteorology at the Royal College of Science.

Among his publications are *The Air and Its Ways* (1923), *The Smoke Problems of Great Cities,* with J. S. Owens (1925); and *Forecasting Weather* (1939). He was knighted in 1915.

SHAW-LEFEVRE, lĕ-fē'vĕr, **George John,** (1st Baron Eversley), English statesman: b. London, England, June 12, 1831; d. Winchester, April 19, 1928. He was educated at Eton and at Trinity College, Cambridge. In 1855, on completion of his studies in law, he was called to the bar, and from 1863 to 1895 sat as a Liberal in the House of Commons, where his maiden speech was a plea for the Northern cause in the American Civil War. He held many government posts. Among them was secretary to the Board of Trade (1869–1871), secretary to the Admiralty (1871–1874), member of the Gladstone cabinet as postmaster general (1883–1885) and first commissioner of works (1892–1894), and president of the Local Government Board (1894–1895) under Lord Rosebery. Defeated for re-election in 1895, he became a member of the London County Council (1897–1901), where he worked for slum removal. He was raised to the peerage as Baron Eversley of Old Ford in 1906.

SHAW UNIVERSITY, an institution for the education of Negroes at Raleigh, N. C. It was founded under the auspices of the American Baptist Home Mission Society primarily for the education of Negro preachers for the Baptist ministry. Henry Martin Tupper was appointed president, and in 1865 organized the first classes in a Negro cabin on the outskirts of the city. In March 1866 the first class for Negro women was enrolled. Since then the school has been coeducational. In 1870 the present campus, including a whole city block, was purchased, and the buildings were put up with brick made by the students. The university was chartered by the state legislature in 1875. It now includes the Normal, Collegiate Scientific, and Industrial departments, the Theological School, the Missionary Training School, the Leonard Schools of Medicine and Pharmacy, and the Law School. The degrees of A.B. and B.S. are conferred.

SHAWINIGAN FALLS, shâ-wĭn'ĭ-gân, city, Quebec, Canada, in St. Maurice County on the St. Maurice River 21 miles north of its confluence with the St. Lawrence at Three Rivers. An important industrial city, it is situated immediately above the great 160-foot falls on the St. Maurice, one of the largest and most beautiful cataracts in Canada. From it a large hydroelectric plant produces power to the extent of nearly 500,000 horsepower. The chief local industries produce pulp and paper; acids, alkalies and salts; aluminum and smelter products. The city is served by branches of the Canadian National and Canadian Pacific railways, which connect with Montreal. It was founded in 1899 and incorporated as a city in 1909. Pop. (1951) 26,903.

SHAWINIGAN SUD or **SHAWINIGAN SOUTH,** town, Quebec, Canada, adjacent to Shawinigan Falls. Chiefly residential, it has a few industries, such as small sawmills and bakeries. Incorporated with Almaville in 1953, its population was 7,964.

SHAWL, shôl, a square or oblong cloth wrap worn loosely over the shoulders—among civilized nations chiefly by women. It is an ancient garment, as its simplicity would suggest. Many very old writers refer to it. The oldest shawls we have, and the finest, were made in Kashmir, where our most beautiful shawls are still made today, by methods used for many centuries. Even the patterns have changed very little. The fabric is woven from a very fine cashmere yarn made from the under wool of the shawl goat of the Himalayas.

The yarn, known as pashmina, which is in reality a fine thread, commands a high price in the market—$9 to $12 a pound. The dyes used are permanent. The patterns of the shawls are produced by weaving, and by embroidery. Where the design is to be embroidered the ground of the shawl is of a plain pashmina fabric. Very primitive looms are employed. Three or four men sometimes work at one loom, and for some of the finer shawls a year's time is necessary. The more ordinary shawls are produced about five a year, to each loom. Sometimes these shawls are woven in separate portions, and afterward joined together with great skill. Cashmere shawls sell as low as $70 or $80, but one of a first-class pattern and coloring will cost $1,200 to $1,500. Such a shawl will weigh about seven pounds and the texture will be very fine and close and the design intricate. About $150 will represent the cost of the materials used, $750 the labor expended and $600 the duty to be paid and other expenses. In the Punjab of India inferior shawls are manufactured at Nurpur, Amritsar and also in Kerman, Persia, the art having been carried over from Cashmere. The fine pashmina is mixed with the coarser goat's wool, called kaork. The finest shawls in Persia are also made of silk to resemble Cashmere shawls.

The production of shawls was until recent years a very important manufacture in France, and gave occupation to many in Paris, who not only furnished designs for those woven in their own country—chiefly at Paris, Lyon and Nimes—but also for shawl-manufacturers in England and Austria, and even for some woven in Cashmere. In 1867 it was estimated that the annual value of the French shawl trade amounted to nearly a million pounds sterling. At Paisley in Scotland, where for many years previous to 1860 the manufacture of shawls was of great importance, the trade originated in the beginning of the 19th century, and at its height occupied 8,000 looms. They were made of silk, wool or cotton, either separately or in combination; but the best-known class of Paisley shawls was manufactured of fine wool imitating Cashmere designs. Soon after the middle of the century the manufacture began to decline and has now ceased. Tartan shawls, however, chiefly of small size, for indoor or occasional wear, are still made at several places in Scotland.

SHAWNEE, shâ-nē′, city, Oklahoma, Pottawatomie County seat, alt. 1,080 feet; on the North Canadian River, which is not navigable; the Chicago, Rock Island and Pacific; the Atchison, Topeka and Santa Fe; and the Oklahoma City, Ada and Atoka railroads; by rail, 39 miles southeast of Oklahoma City. It has a commercial airport and is on modern highways. Situated close to the geographical center of the state, Shawnee is in a wide agricultural region producing diversified crops—principally cotton, corn, oats, alfalfa, peanuts, blackberries, potatoes, and pecans. It is the trading center for an extensive area which includes a number of smaller municipalities. Twenty-eight miles northeast is Tinker Air Force Base, employing many Shawnee residents. There are flour and feed mills, and cotton gins and compresses. Tents and awnings and electrical equipment are produced in the city's factories.

Educational and cultural interests center in public and parochial grammar schools and a public high school, a Carnegie library, daily and weekly newspapers (local and county), and several theaters. Shawnee is the seat of Oklahoma Baptist University and St. Gregory's College. St. Gregory's has a museum and an art gallery with some highly valued paintings. Average enrollment in the two colleges is 1,500. In 1940 Shawnee had a National Youth Administration school for training boys, and a Civil Aeronautics Authority training course in connection with the local airport and the Oklahoma Baptist University. There is a federal building. The city has an adequate system of parks, playgrounds, and recreational centers.

Located on lands originally belonging to the Shawnee tribe of Indians, the town was first called Shawnee Town. It was founded in 1895, and was incorporated in 1896. The city government is administered by a commission with a city manager. The water supply system, using surface reservoirs with a capacity of 7.4 billion gallons, is municipally owned and operated. When Oklahoma became a state, in 1907, Shawnee had a population of 10,955. Pop. (1940) 22,053; (1950) 22,948.

SHAWNEE INDIANS (contracted from the Algonquian *Shawanogi,* "southerners"), an important tribe of the Algonquian stock of North American Indians, who, according to the best evidence, were originally an offshoot from the Lenape or Delawares, which migrated southward, hence their popular name. It is believed that they entered the present limits of the United States from the territory north of the Great Lakes via the lower peninsula of Michigan, various bands or divisions settling in southern Illinois, southern Ohio and (the larger part) on Cumberland River. A portion of the latter drifted southeastward to the headwaters of the Savannah, where they came in contact with the Cherokees and Catawbas, who forced them northward into Pennsylvania by 1707, while those remaining on Cumberland River were driven away by combined Cherokees and Chickasaws. They were first mentioned under the name Ouchaouanag, in 1648, as living to the westward of Lake Huron; later in the century they were found by La Salle in northern Illinois, while others were settled along the Ohio and the Cumberland, and indeed had extended into Maryland, Virginia and Pennsylvania, and even as far south as Mobile, Ala., in the country of the Creeks. They were at war with numerous tribes at various periods, as well as with the French, and later with the United States, from the beginning of the French and Indian War until about 1795, during which time they had concentrated north of the Ohio River. Anthony Wayne's victory, followed by the Treaty of Greenville in 1795, terminated the hostilities of the Indians of the Ohio Valley region, a considerable part of the Shawnees moving to Missouri, within Spanish territory, while a few years later others migrated to White River, Ind., on invitation of the Delawares. Early in the 19th century, Tenskwatawa, the "Shawano Prophet," brother of the celebrated Tecumseh, preached a new doctrine the acceptance of which would open the way to future happiness and a return of the old order of things, not unlike the "Ghost Dance" religion which in-

volved so many of the Western tribes beginning with 1890. The Prophet gathered many adherents from far and wide, who established themselves at the mouth of Tippecanoe River, Indiana. To overcome their hostile demonstrations, General Harrison in 1811 led an expedition against them, resulting in the defeat of the Indians in the celebrated battle of Tippecanoe and the destruction of their settlement, while the tragic death of Tecumseh, their recognized leader, in the following year, tended to break their hostile spirit. The Shawnees of Missouri sold their lands to the government in 1825 and were assigned to a reservation in Kansas, but meanwhile a large number of them had departed for Texas where they settled on the headwaters of Sabine River until driven out in 1850. In 1831 the Ohio Shawnees ceded their lands to the United States and joined their kindred in Kansas, and in 1845 a large part of these Kansas Shawnees moved to the Canadian River in Indian Territory, where they soon came to be officially known as Absentee Shawnees. In 1867 the mixed Shawnees and Senecas who had moved from Ohio to Kansas about 1831, also migrated to Indian Territory, where they became known as Eastern Shawnees, and in the meantime the rest of the tribe joined the Cherokees in Indian Territory, with whom they are now incorporated. The Shawnees known as Black Bob's band are those who at first refused to move from Kansas with the others. There are also Shawnees among the Tuscaroras in New York, and others are incorporated among the Teton Sioux, while in 1840 a number of the tribe accompanied a party of trappers to the Tulare Valley of California.

The Shawnees were early described as of good stature, an active, sensible, cheerful people, full of laughter and drollery, courageous, high-spirited and manly, yet "the most deceitful in human shape." Each town had its headman. Polygyny was common and infanticide frequently practised. It was said that most of the Shawnees could speak several languages, due, no doubt, to their roving propensities when occasion required, although they were agriculturists in the main. The tribe had four phratral organizations, the members of which occupied different sides in the council-house during public assemblies. So far as known 13 gentes were recognized. Of the population of the Shawnees in early times there is no reliable information, the estimates ranging from 1,000 in 1736 to 2,000 in 1817. In 1910 the population of the Shawnee aggregated 1,338, of whom 1,300 were in Oklahoma. In 1926 there were 176 Eastern Shawnees on the Quapaw Agency in Oklahoma, and 565 Absentee Shawnees on the Shawnee Agency in the same State.

F., 'Two Journals of Western Tours' (1759); Thomson, C., 'Causes of the Alienation of the Delaware and Shawnee Indians from British Interests' (Philadelphia 1759).

F. W. Hodge,
Museum of the American Indian, Heye Foundation, New York.

SHAYA ROOT, the root, or the plant itself, of *Oldenlandia umbellata,* of the madder family, and sometimes called Indian madder. It is a slender branching annual, with narrow opposite leaves, and small flowers in panicles. It grows wild, and is also cultivated, on the Coromandel coast, the outer bark of its roots yielding the well-known durable red-dye seen in Indian cotton goods. The leaves have been used as an expectorant in native medicine.

SHAYS, shāz, **Daniel,** American soldier, leader of the "Shays' Rebellion" in Massachusetts: b. Hopkinton, Mass., 1747; d. Sparta, N. Y., 29 Sept. 1825. He is first heard of as an ensign at Bunker (Breed's) Hill, was made captain 1 Jan. 1777 and resigned from the service. There is testimony that he was a good soldier. The rebellion of 1786–87, in which he was the directing figure, arose from a spirit of unrest and lawlessness then generally on the increase in the country, but more particularly from special reasons for dissatisfaction in Massachusetts. Among these were the wastefulness in the costs of litigation, the high salaries attached to public offices, and above all the exorbitant land taxation. The time was one of financial depression, and Governor Bowdoin in his endeavors to sustain the credit and diminish the debt of the State undoubtedly caused heavy burdens to fall upon poorer citizens inland. Sheriffs' and County Courts were kept busy. In the fall of 1786 five or six hundred malcontents, under command of Shays, gathered at Springfield, the purpose being to overawe the Supreme Court about to sit there and prevent the finding of indictments. After a three days' session the court adjourned. In November, when the Court of General Sessions attempted to sit at Worcester, Shays filled the courtroom with an armed force and no court could be held. Washington was deeply alarmed at the reports of these early successes of the insurgents. "It was but the other day," said he, "that we were shedding our blood to obtain the constitutions under which we now live — constitutions of our own choice and making — and now we are unsheathing the sword to overturn them." An army of 4,400 was now enlisted for 30 days by Governor Bowdoin, and the money for equipment and munitions was raised by a loan from wealthy citizens. The command was given to Gen. Benjamin Lincoln, a Revolutionary veteran. On 25 Dec. 1787 Shays, with 1,100 troops, made an attack on the Springfield arsenal, guarded by General Shepard with 1,200. Shepard at first commanded his men to fire above the insurgents' heads, but as the latter continued to advance in good order, a volley was directed into their ranks. Four fell, and the insurgents retreated in much confusion, continuing their flight, with many desertions, from town to town. Lincoln pursued them to Petersham, where on 3 February 150 were taken and the rest dispersed. The rebels continued to gather in small bands, for some months, but no large force again appeared. The greatest clemency was shown toward the leaders, and a very general amnesty

proclaimed. Shays removed to Vermont, was pardoned and went thence to Sparta, N. Y., where he obtained a pension for his Revolutionary services.

SHAYS' REBELLION. See SHAYS, DANIEL.

SHCHERBAKOV or **RYBINSK,** USSR, district and town in the Yaroslavl region, about 50 miles northwest of Yaroslavl, on the Volga, opposite the mouth of the Sheksna, which forms the first link in the waterway system constructed in the 19th century to establish direct water communication between the Volga and St. Petersburg (Leningrad). Shcherbarov is an important transshipment center, has an active grain and hemp trade, and manufactures printing presses, road machines, and ships. Near it two large hydroelectric stations were under construction when World War II broke out. Pop. (1939) 139,011.

SHE, a romance by Rider Haggard (1887), a young Englishman goes to Africa to avenge the death of an Egyptian ancestor, whose strange history has come down to him in an old manuscript. The ancestor, a priest of Isis had been slain by an immortal white sorceress somewhere in Africa. The sorceress, She, and the Englishman finally meet, recognize a mysterious bond between them and, at the climax of the story, visit a place where burns a mysterious fire which gives thousands of years of life, loveliness, strength and wisdom or else swift death. She for the second time passes into the flame and is instantly consumed.

SHE-OAK, any one of the small trees or shrubs of the peculiar genus (*Casuarina*) of oaks, native to the East Indies and Australia. Although closely related to oaks and walnuts, the she-oak has no true leaves, substituting whorls of long drooping, slender deciduous branchlets and is said to resemble both Scotch firs and giant horsetails, in its wide-spreading top. It casts but little shadow. The branchlets are acidulous in taste and are liked by cattle. A small and round fruit is called the she-oak apple and is of bitter taste and used to flavor beer. The wood of the she-oak is extremely hard, makes excellent fuel and is valuable for woodworking; in some species it is reddish, with light and dark streaks, and is called beefwood.

SHE STOOPS TO CONQUER. Though he was thoroughly a child of his time, it was Goldsmith's peculiar genius that he went to life for his influences rather than to books. The central feature of *She Stoops to Conquer* has some resemblances with Farquhar's *The Beaux' Stratagem,* but its veritable source was undoubtedly an episode in the youthful career of Oliver himself.

If in the theater Goldsmith seems to have been more of a reformer than elsewhere the reason is not far to seek. The refinements of that sentimental comedy which in his day controlled the stage were repugnant to him as an instinctive artist. Before his playwriting days Goldsmith had ridiculed "genteel comedy" and in the "low" passages of *The Good-Natured Man* had resolutely entered the lists against it. *She Stoops to Conquer* is the author's second and more successful play. Less artificial than the comedy of manners, to which general class it belongs, it has more of Fielding in it than of Congreve. No one but Goldsmith could have given such a view of a country house. And even the London characters are freshly viewed. Their city manners are crossed with the forthrightness of nature. Raillery and repartee dwindle in importance before character and atmosphere. The difference between Goldsmith and Sheridan was that the former knew life whereas the latter knew only the stage. Squire Hardcastle is drawn without a stroke of over-elaboration. Less sportive than Tony he digs as deeply into the memory; but Tony and his mother linger as something more than caricatures. Kate Hardcastle is as much a product of observation as Millamant of *The Way of the World* is a product of thought and Maria of *The School for Scandal* is a product of the stage. It is the veritableness of the atmosphere of the play that saves it from, what the plot would make it, sheer farce. Goldsmith was not fortunate in his relationships with Colman and Garrick, the two monopolists of the theater of his day. Yet upon its performance by Colman at Covent Garden Theater, March 15, 1773, *She Stoops to Conquer,* "succeeded prodigiously" (Walpole). It holds the stage in frequent revivals to this day. *Editions:* Masson, D., *Globe* edition (1869); Dobson, A., ed., Belles Lettres Series (1905); Temple Dramatists (1900); Everyman's Library (Vol. 415).

THOMAS H. DICKINSON.
Former Professor of English, University of Wisconsin.

SHEA, shā, **John Dawson Gilmary,** American historian: b. New York, July 22, 1824; d. Elizabeth, N. J., Feb. 22, 1892. His father was principal of the Columbia College Grammar School where he gained his education, and subsequently he studied law and was admitted to the bar in 1846. He soon turned to literature, was connected in an editorial capacity with Frank Leslie's publishing house and later edited the *Catholic News.* But for many years his attention was given to historical research in preparation of his *History of the Catholic Church in the United States,* the fourth volume of which was in process of publication at the time of his death. He was connected with many historical societies in America and Europe and was the first president of the Catholic Historical Society of the United States. His published works include *The Discovery and Exploration of the Mississippi Valley* (1853); *History of the French and Spanish Missions Among the Indian Tribes of the United States* (1854); *The Catholic Church in Colonial Days* (1883); *The Hierarchy of the Catholic Church in the United States* (1886); *Early Voyages Up and Down the Mississippi* (1862); *Novum Belgium, An Account of the New Netherlands in 1643–44* (1862); *The Operations of the French Fleet under Count de Grasse* (1864); *Life of Pius IX* (1875); *Story of a Great Nation* (1891), besides many translations and other works.

SHEAFFE, shēf, SIR **Roger Hale,** Canadian general and administrator: b. Boston, Mass., July 15, 1763; d. Edinburgh, Scotland, July 17, 1851. He was appointed ensign in the

British Army in 1778 and was promoted lieutenant in 1780. He served in Ireland (1781–1782) and in Canada (1787–1789). He was on active duty in Holland in 1789 and accompanied the expedition to the Baltic in 1801. He returned to duty in Canada in 1802, reached the rank of major general in 1811 and was on leave for a year. He was again on active duty in Canada in 1812–1813 and on Oct. 13, 1812 at the Battle of Queenston Heights he was in command of the forces that recaptured Queenston from the United States troops. He retained command of the British forces in Canada and administered the government of Upper Canada until 1813 when he was recalled to England. He rose to be a lieutenant general (1821) and a general (1828). He was knighted in 1813 in recognition of his services at Queenston.

SHEAR, shēr, **Cornelius Lott,** American plant pathologist: b. Coeymans Hollow, N. Y., March 26, 1865. After completing his college education Shear studied in Europe and in 1898 became a full-time assistant agrostologist in the United States Department of Agriculture. In 1901 he became assistant pathologist in the department, and principal pathologist in charge of mycology and disease of plants from 1925 to 1935 when he retired. He has held offices in many scientific organizations and his special research on cotton, grapes, cranberries, grass and forage plants is noteworthy.

SHEAR, Theodore Leslie, American archaeologist: b. New London, N. H., Aug. 11, 1880; d. Lake Sunapee, N. H., July 3, 1945. Except for a year in the American Army Air Force in World War I, Shear's life was devoted to archaeology and classical art. He conducted excavations at Cnidus (1911), Sardis (1922), and Corinth (1925–1931). A lecturer on art and archaeology at Princeton University (1921–1927), professor of classical archaeology from 1928, he was also curator of classical art in the museum of the American School of Classical Studies at Athens (1936–1942); director of the excavation of the Athenian Agora (1930–1942), and wrote articles for periodicals, and books on his discoveries.

SHEARD, shērd, **Charles,** American biophysicist and physiological opticist: b. Dolgeville, N. Y., May 27, 1883. After taking degrees at St. Lawrence, Dartmouth, Princeton, and Los Angeles colleges, Sheard began teaching in the New York public schools, then at Dartmouth and Ohio State colleges, becoming director of the division of physics and biophysical research at the Mayo Clinic from 1924 to 1949, when he became emeritus director. He was on the board of directors of the National Society for the Prevention of Blindness, and consultant to the United States Navy from 1947. He founded the Sheard Foundation for Education and Research in Vision at the graduate school of Ohio State University in 1943. His major fields of research have been in ocular refraction, effects of radiant energy on plant and animal tissues, and the visual problems of aviation. He published *Ophthalmic Optics* (1949) and *Problems of Binocular Vision* (1953).

SHEARMAN, Sir **Montague,** English judge and athlete: b. Wimbledon, England, April 7, 1857; d. London, Jan. 6, 1930. Becoming a barrister in 1903, Sir Montague presided at many famous murder trials. He was a noted rugby player and all around athlete, and president of the Amateur Athletic Association in 1915.

SHEARMAN, Thomas Gaskell, American lawyer and economist: b. Birmingham, England, Nov. 25, 1834; d. Brooklyn, N. Y., Sept. 29, 1900. Admitted to the New York bar in 1859, Shearman compiled a reference book on procedure, the first volume with John L. Tillinghast, the second alone, called *Practice, Pleadings, and Forms in Civil Action in the Courts of Record in the State of New York* (1861–1865), which was used until 1877, when the law was changed. As a partner in the law firm of David Dudley Field, he was concerned with lawsuits of the Erie Railroad. He withdrew in 1873 to form a new firm with John W. Sterling. He defended Henry Ward Beecher without pay in the suit brought by Theodore Tilton (1874–1875), was counsel for Jay Gould and James J. Hill, and often gave his services to indigent clients. Perhaps best known for his support of Henry George and the single tax (a name Shearman invented), he wrote *Natural Taxation* (1895) which advocated a single tax on ground rents. See also Single Tax.

SHEARS. See Cutlery; Hardware Industry.

SHEARWATER, one of several sea birds of the family Procellariidae which consists of the petrels, fulmars, and shearwaters. These and the related but much larger albatrosses form an order of birds, the Tubinares or tubenoses, so called because of their tubular nostrils. They are strictly maritime and occur throughout the oceans or other large bodies of salt water such as the Mediterranean and the Gulf of California. They come to land only for nesting, some species remaining continuously at sea for periods of six to nine months. The shearwaters are larger than the petrels and differ from them and the fulmars by having a longer and more slender bill and longer and narrower wings. They get their common name from the manner in which they glide over the sea with stiff wings to skim the surface for particles of food, alternately rising, banking, and plunging steeply downward with perfect mastery even during the fiercest gales. The better known shearwaters are perhaps the Greater (*Procellaria gravis*), the Sooty (*P. grisea*), and the Manx (*P. puffinus*) which is less pelagic than the others, frequenting chiefly offshore waters.

SHEATHBILL, a bird of the family Chionididae consisting of only two species that inhabit the southern end of South America and the islands off the Antarctic continent. They have the general appearance and flight of a pigeon but are believed to be related to the shore birds. Sheathbills are all white with a small bare patch of skin on the face and have the base of the upper bill covered by a horny sheath, hence their common name. They are omnivorous, bold scavengers and are said to be fearless of other animals including man.

SHEBA, shē'bà, or **SABA** (Arab. Saba'), ancient country of Biblical times, Arabia, probably including modern Yemen and Hadhramaut, although its precise site has not been determined. It was a great commercial center of the Semitic tribes. The Sabaeans carried on an extensive trade with India, Europe, Egypt, and Syria, in frankincense, gold, ivory, ebony, textiles, sweet spices, and for

this purpose had depots in northern Arabia and Ethiopia. Their wealth became famous in the Orient and their queen paid a visit to Solomon bearing rich gifts, according to the story in I Kings 10:1 fol. A late Arabic version identifies her as Balkis, but asserts that Solomon visited her at Yemen where she tested him with many riddles.

The Sabaeans worshiped the sun and the moon. In the 8th century they were subject to the Assyrians; in 24 B.C. the Romans sent an unsuccessful expedition into their territory and in the 2d, 4th and 6th centuries they became subject to the Ethiopians.

SHEBOYGAN, shē-boi'găn, city, Wisconsin, and Sheboygan County seat, altitude 589 feet; on Lake Michigan, at the mouth of the Sheboygan River; on Chicago and North Western Railroad; by rail, 52 miles north of Milwaukee. There are Great Lakes steamship connections and an airport. Sheboygan is a port of entry, Customs District 37; its harbor is open all year. The city is a lake fishery center, and a shipping point for millions of pounds of cheese annually produced in the county. Its principal industries and manufactures are furniture; enamelware, plumbing and heating equipment, shoes, toys, knit goods, gloves, machinery, boxes and crates, metal fabrication, and other items in a well diversified list. These activities reflect the nature of the city's environment, with Lake Michigan on one side and wooded lands and farmlands on the other, supplying lumber and dairy products.

Sheboygan has 12 public elementary schools, 11 parochial schools, two high schools, and a junior high. There is also a business college. The city has 15 parks, large and small, supervised playgrounds, and a recreational center maintained by the Y.M.C.A., and a service club; also a natural "bowl" or amphitheater. There are 45 churches and two hospitals. In addition to the usual civic and social organizations, the city has a number of musical organizations: the Civic Music Association, the Civic Symphony, the Sheboygan Music Club, the A Cappella Choir, and the municipal band.

History.—The city's name is held to be from Indian words meaning "send through, drum." In 1820 a trading post was set up near the mouth of the Sheboygan River. Incorporation as a village occurred in 1846, and Sheboygan was chartered as a city in 1853. In 1845, when Fourierism (q.v.) flourished in parts of the United States, the Wisconsin Phalanx was established near Sheboygan. It broke up in 1848. While it lasted, it was, after Brook Farm, one of the most important American phalanges. Sheboygan has the mayor and councilmanic form of government. There is an excellent public library. The water supply system and sewage disposal plant are municipally owned. Pop. (1950) 80,631.

SHEDD, shĕd, **William Greenough Thayer**, American theologian: b. Acton, Mass., June 21, 1820; d. New York, Nov. 17, 1894. He was graduated from the University of Vermont in 1839, from Andover Theological Seminary in 1843 and in 1844–1845 was pastor of the Congregational Church in Brandon, Vt. He was professor of English literature in the University of Vermont in 1845–1852, of sacred rhetoric and pastoral theology at Auburn Theological Seminary in 1852–1853 and of ecclesiastical history and lecturer on pastoral theology at Andover in 1853–1862. He acted as assistant pastor at the Brick (Presbyterian) Church, New York, in 1862–1863, was appointed to the chair of Biblical literature at Union Theological Seminary, New York, in 1863, and in 1874 was transferred to that of systematic theology, which he occupied until 1890.

His publications include: *The Method and Influence of Theological Studies* (1845); *The True Nature of the Beautiful and its Influence upon Culture* (1851); *The Nature and Importance of Natural Rhetoric* (1851); *Lectures on the Philosophy of History* (1856); *A History of Christian Doctrine* (1863); *Homiletics and Pastoral Theology* (1867); *Sermons to the Natural Man* (1871); *Theological Essays* (1877); *Literary Essays* (1878); *Commentary on St. Paul's Epistle to the Romans* (1879); *Sermons to the Spiritual Man* (1884); *Doctrine of Endless Punishment* (1885); *Dogmatic Theology* (1889–1894); *The Proposed Revision of the Westminster Standards* (1890), etc.

He also published *Eloquence a Virtue, or Outlines of a Systematic Rhetoric* (1850), a translation from the German of Dr. Francis Theremin; *A Manual of Church History* in two volumes, translated from the German of Heinrich Ernst Ferdinand Guericke (1857); edited seven volumes of Coleridge's works, with *Introductory Essays* (1853); *The Confession of Saint Augustine*, with introductory essay (1860); and wrote introductions to Asbury's translation of Ackerman's *The Christian Element in Plato and the Platonic Philosophy* (1860) and to McCosh's *Intuition of the Mind* (1864).

SHEE, shē, Sir **Martin Archer**, English painter: b. Dublin, Ireland, Dec. 23, 1770; d. Brighton, England, Aug. 13, 1850. He was introduced in 1788 to Sir Joshua Reynolds by Edmund Burke, and in the same year became a pupil in the Royal Academy, to the exhibition of which he contributed his first picture in 1789. Although by no means the best portrait painter of his time, he was, with one or two exceptions, the most fashionable. In 1800 he was chosen a member of the Royal Academy, and in 1830, on the death of Sir Thomas Lawrence, he was elected president and knighted. He also aspired to literary distinction and in 1805 and 1809 published two parts of a poem entitled *Rhymes on Art*, in 1814 *The Commemoration of Sir Joshua Reynolds, and other Poems*, which called forth the praise of Byron, in his *English Bards and Scotch Reviewers:*

> "And here let Shee and genius find a place,
> Whose pen and pencil yield an equal grace;
> While honors, doubly merited, attend
> The poet's rival, but the painter's friend."

Among his portraits are those of William IV and Queen Victoria; all his work is pleasing, but there is an unpleasant tendency to unnatural redness in his flesh tints. The National Portrait Gallery contains numerous examples of his works.

SHEEDY, shē'dē, **Morgan M.**, author, lecturer, priest: b. Liscarroll, County Cork, Ireland, Oct. 8, 1853; d. Altoona, Pa., Oct. 25, 1939. His mother, Mary (Madden) Sheedy, was a member of a family which has given many priests and distinguished writers to the world. He was educated at St. Colman's College, Fermoy, and at the College of Maynooth; received degree of LL.D. from Notre Dame Uni-

versity, Indiana, and Mount Saint Mary's, Maryland. Ordained in the Pittsburgh Cathedral by the late Bishop Tuigg, 23 Sept. 1876; assigned as professor of theology and history at Saint Michael's Seminary, where he continued until the institution was closed. First president of the Catholic Summer School of America and director of the Reading Circle Union; vice-president of the Catholic Total Abstinence Union for four years. Founder of the Pittsburgh Polytechnic Society. He lectured for the Academy of Science at the Champlain Summer School and the first session of the Catholic Winter School in New Orleans. Since 1894 permanent rector of Saint John's Church, Altoona, Pa. Editor of *The Quarterly* and a frequent contributor to the Catholic press and magazines, the *Catholic World,* The *American Ecclesiastical Review,* etc. Author of 'Briefs for Our Times'; 'Social Problems' (dealing with the labor question); 'Christian Unity,' etc.

SHEEHAN, shē'ăn, **Patrick Augustine,** Irish Roman Catholic canon and novelist: b. Mallow, County Cork, 17 March 1852; d. 6 Oct. 1913. He was educated at Maynooth College and was ordained in 1875. He held various curacies until 1895 when he became parish priest of Doneraile, and in 1903 he became also canon of Cloyne. He was known as a writer of essays, poems and novels, all of which are characterized by an intimate knowledge of Irish life and permeated with a strong Roman Catholic bias. Author of 'Under the Cedars and Stars' (1903); 'The Triumph of Failure' (1899); 'My New Curate' (1900); 'Early Essays and Lectures' (1906); 'The Blindness of the Rev. Dr. Gray' (1909); 'The Queen's Fillet' (1911); 'Graves at Kilamorna' (1915), etc.

SHEEP. The sheep (genus *Ovis*) belongs to the family of ruminants termed Bovidæ, of which the ox (*Bos*) is a typical representative. Other animals such as the goat, musk-oxen, chamois and antelope belong to the same family but the sheep represents a distinct genus for which the name *Ovis* has been adopted, and, as a species, the domesticated sheep has been given the name *Ovis aries.*

Sex and Age Names.— The male sheep is known as a *ram* or *buck.* The term buck, however, is not regarded as good usage, but it is almost universally applied to male sheep in the western part of the United States. The female sheep is known as a *ewe* and the unsexed male as a *wether.* From birth until the age of 12 months is attained the young of sheep are called lambs; from 12 to 24 months of age they are called yearlings; from 24 to 36 months, two-year olds, et cetera.

How to Determine the Age of Sheep.— Until sheep become four years old their age can be approximated by their teeth. The temporary or lamb teeth, 20 in number, are small; the permanent teeth, of which there are 32, are broader and longer. As a rule the two temporary teeth in the middle of the front part of the lower jaw are replaced by permanent teeth when the animal is about 12 months old and two more appear each year until at four years of age all of the front teeth are permanent, making what is called a full mouth. Therefore, a sheep showing two broad teeth in front is called a yearling; one showing four broad teeth, a two-year old; one showing six such teeth, a three-year old. Beyond the fourth year it is not possible to approximate age except in a very general way, but the teeth of a very old sheep are likely to be spread apart, missing or they may be worn down short. Other indications of advanced age are a sunken appearance over the eyes, comparatively short wool that is more or less uneven in length and a tendency toward emaciation.

Habits.— Sheep are ruminants and while they are fond of concentrated feeds they must have bulky feeds such as grass and hay. They eat all of the grasses except the very coarsest varieties and they are very fond of the cultivated leguminous plants. They eat most of the weeds common to the farms and ranges of the United States and they will feed on young tree-growth more than any other domestic animal in America except goats.

Sheep like an extensive range and comparatively short herbage. Because of their mobile lips and sharp incisor teeth they are structurally adapted to feeding on short grass. They enjoy changing from old to new pastures and they delight in feeding on the high places more than they do on the low places in their pastures. Sheep are able to exist without water longer than most domestic animals, but nevertheless they should have free access to it. Even in cold weather they will drink from two to four quarts daily. They prefer running water to still water.

In seeking a bedding-place sheep prefer relatively high ground where there is good air and water drainage. It is only in the severest periods of storm that they abandon such a place for a lower, wind-protected location. Young sheep seek high places more readily than do older ones; yearlings will feed high up on a hillside more readily than old ewes.

Breeding Habits.— Most domesticated breeds produce offspring but once a year. In the United States the mating is in the autumn, because it is at this time that the nights turn cool and this seems to have a marked influence in causing the ewes to come in heat (œstrus). The normal gestation period for ewes is about 146 days. Ewes commonly give birth to one or to two lambs. Occasionally triplets are born and in rare instances four or more. But since the female sheep has only two teats, breeders do not desire more than two lambs to each ewe.

Gregariousness.—All sheep possess the flocking instinct, but it is more pronounced in some breeds than in others. This instinct is of great importance in regions where sheep are herded on rough unfenced range, and a breed of sheep must be kept that possesses it in the most marked degree. When a sheep is separated from the flock it is an indication that it is either lost, ill or injured.

Closely associated with the gregarious instinct is the instinct to follow a leader. "Where one sheep goes all others will follow" is literaly true even though it involves a long leap or a plunge into the water.

No other domestic animal is so timid and so unable to defend itself as the sheep. On this account it is a subject of prey for such animals as the wolf, coyote, dog, bobcat and mountain lion. In all countries where sheep are kept there are predatory animals of the canine and feline groups that harass sheepmen by the attacks they make upon their flocks.

Types.— Sheep were probably first domesti

cated on the high, treeless plateaus and mountains of Turkestan, Asia, but they have been adapted to all sorts of climatic conditions and to all types of soil. Under the influence of not only soil and climatic conditions but of economic and social conditions as well, different types of sheep have been developed. At the present time most of the improved sheep may be roughly grouped under two types; one known as the fine wool type, the other as the mutton type. As these type names infer, there are sheep that have been developed primarily for their wool and others primarily for their mutton. In certain restricted areas of the world, notably in Europe and Asia, emphasis has been placed on the dairy qualities of sheep and in Asia there are types whose value depends chiefly upon the fur-like nature of their hairy covering, the lambskins of which yield what are known as the Persian, Astrakan, Broadtail and Krimmer furs.

The wool type of sheep was developed in Spain and it is known the world over as the Merino. For a long time Spain denied these sheep to the remainder of the world, but at the close of the Napoleonic wars she was no longer able to retain her monopoly on them and they were rapidly distributed in other countries. Before this time, however, the king of Spain gave permission for some of these sheep to be sent to a few other European countries and Saxony in Germany had demonstrated that they could be successfully raised outside of their native home. Consequently there was great demand for them when they became available to all countries. Germany, the United States and Australia specialized in them and made them better than they had been at home.

In the United States, the Merino was first called the Spanish Merino. But various strains that had been kept separate and distinct in the native home were mingled in America. This together with different ideals in breeding soon resulted in a modified type which was first called the Vermont Merino and later the American Merino.

American Merino breeders aimed at great weight and fineness of fleece. In order to get weight, large wrinkles and folds were developed in the skin. A maximum density of wool fibres on the surface of the skin was sought after; an attempt was made to grow wool on all parts of the body and on the face and legs as well and the greatest amount possible of yolk (a combination of the perspiratory and fatty secretions from the skin) was secured. Very little attention was given to mutton properties.

This kind of sheep satisfied earlier conditions in the United States because wool was almost the sole product from flocks in regions west of the Alleghany Mountains. There was no object in producing mutton, for transportation facilities were undeveloped. If they had been developed the population of the country was too small to justify a large production of mutton and facilities for exportation were inadequate. This situation, together with the fact that no other sheep has the gregarious instinct so intensely developed and hence is not as suitable as the Merino on expansive, unfenced ranges, explains why the Merino has always been the popular sheep in new countries and why they were adopted not only by the United States, but also by New Zealand, Australia, the Argentine and South Africa.

But as demand for mutton increased in the United States because of the increase in population and as transportation developed so that this demand could be met, changes became necessary in Merino breeding. There was also a change in the style of cloth which demanded the production of longer wool — a wool at least two and one-half inches in length so that it could be spun into worsteds. As a result strains were developed that grew longer wool and produced more meat.

At present there are three types of American Merinos known as the A, B and C types The A type is extreme in skin folds and wrinkles, density of fleece and yolk in the wool. It is what might be called an ultra wool type. The C type or Delaine is almost free from folds and wrinkles, and its wool is not so dense, has less yolk and is longer than that of the A type. It is wider, thicker and heavier and altogether much more suitable for mutton than the A type. In practically all respects, the B type is intermediate between the A and C types. Most Merino rams have horns, but the ewes are hornless. Rams weigh from 130 pounds to 200 pounds and their weight of fleece in the grease (i.e., weight just as it comes from the sheep) ranges from 25 pounds or more in the A type to 15 pounds or more in the C type. Ewes weigh from 90 to 150 pounds and they shear from 15 pounds up in the A type to 10 pounds up in the C type.

Australian Merinos differ from American Merinos mainly in the nature of their wool. The Australian breeders have bred for long, fine wool and not for excessive yolk as have the American breeders, who have specialized in the A and B types.

In 1786 the French government began growing Merinos, having for its object a combination of mutton and wool. A number of years later some of these sheep were taken to Germany. In both countries a large, thick sheep was developed. Importations were brought to the United States as early as 1840 but they did not attain popularity until toward the close of the century. They are now known as the Rambouillet, and in the United States they outnumber all other Merinos combined. Rams weigh from 225 to 250 pounds; ewes from 140 to 170 pounds. Rams yield from 15 to 25 pounds of grease wool; ewes from 10 to 18 pounds.

The Mutton Type.— England is the native home of the mutton type of sheep. This type was intensely developed by Robert Bakewell who began his work about 1760. Prior to his time there were two general types of sheep in England. One of these was a large, coarse sheep that grew long, coarse wool and yielded a fleece weighing from 7 to 12 pounds. These sheep were kept principally on the low fertile lands of Lincoln, Leicester and on the hills of Gloucester. It was with these sheep that Bakewell accomplished his work and he founded the breed known as the English Leicester.

The other type common to England was much smaller, better able to travel, and was suited to the hills and lighter soils. It produced short, rather fine wool and yielded fleeces weighing from two to five pounds.

Following Bakewell, there was a great era of mutton improvement brought about by careful selection in some cases, by crossing and selection in others. From the lowland sheep the Longwool mutton breeds have been developed, namely, the Leicester, Cotswold, Lincoln, Romney Marsh and others.

All of the long wool breeds strongly resemble each other; they are large, up-standing sheep with white faces and legs. Their wool is coarse and long, ranging from 8 inches in Leicesters to more than 12 in Lincolns.

From the smaller, lighter shearing type, the medium wool mutton breeds have come. In this group the most prominent in America are the Down breeds such as the Southdown, Shropshire, Hampshire, Suffolk and Oxford Down. The Oxford Down, however, is a cross between the Hampshire, a medium wooled breed, and the Cotswold, a long wooled sheep. The Down breeds have dark faces and legs — the darkest being the very deep brown of the Hampshire and Suffolk, and the lightest, the light grayish brown of the Southdown. The Southdown is regarded as the best improved breed in mutton qualities, but in this respect it is closely approached by the other Down breeds. Of the Down breeds, the Southdown has the shortest, lightest fleece, while the Oxford Down has the longest fleece.

There are numerous other medium wool breeds, the most prominent in the United States being the Dorset Horn and Cheviot, which differ from the Down breeds in that they have white faces and legs. Both the males and females have horns in the Dorset Horn breed.

Approximate Body and Fleece Weights of the Mutton Breeds Prominent in the United States.

BREED	Body weight		Weight of fleece, pounds
	Rams	Ewes	
Longwools			
Leicester	250	185	12
Cotswold	300	200	14
Lincoln	325	225	15
Romney Marsh	275	200	12
Medium wools			
Southdown	185	145	7
Shropshire	225	170	9
Suffolk	250	180	8
Hampshire	275	200	9
Oxford Down	285	200	11
Dorset Horn	275	190	7
Cheviot	175	140	7

When refrigeration and transportation developed to the point where it was possible to ship sheep or their carcasses from outlying points to the centres of dense population there arose a demand for the mutton breeds in all countries where improved flock husbandry is practised. In some regions the mutton breeds have replaced the Merinos, but in many others where some Merino blood is indispensable, they have been crossed with the Merino to effect mutton improvement. Breeders in New Zealand by crossing the Longwool breeds on the Merino secure a blend that represented what was needed. Then they bred the cross-bred animals together and thereby in time fixed a new type which is known as the Corriedale. Some of these sheep have been imported to the United States, and crosses between the Longwools and Rambouillets are being made in this country with a view to producing a desirable type of sheep for the intermountain region.

Types of Sheep Raising.— There are two general types of sheep raising. One involves keeping relatively large numbers on an extensive range; the other in keeping comparatively small flocks on farms where diversified agriculture is practised.

The first, generally known as the range method, is followed in the intermountain regions of the United States and Canada, in South America, South Africa, Australia, New Zealand and parts of Asia. Under this method in the United States the sheep are kept in the care of a herder on unenclosed land in bands containing from 1,500 to 3,000 head. The herder requires the whole or part time assistance of a camp tender, whose duty it is to get provisions, and move camp after selecting a new site where there is sufficient pasture; he also assists in cooking, and in counting the sheep. In winter the sheep are kept on the semi-arid plains; in spring and fall in the foot-hills, and in the summer in the national forests on the mountains. It is now customary to supplement the feed on the plains with grain and hay during severe periods in winter. All of the hay and some of the grain are grown on dry farms and irrigated land in the West. The remainder of the grain is shipped in from the Middle West and South. Australia and New Zealand have modified the range method by fencing in vast areas of land. As a result the sheep do not require a herder; they can feed according to their own inclination and hence thrive better than do sheep under a herder's care.

The keeping of small flocks on farms, known as the farm flock method, is practised in the central and eastern parts of the United States, eastern Canada, Great Britain and various other European countries. Flocks vary in size from a few head up to several hundred. As a rule farm flocks share their pastures with other classes of livestock, but in England they are often fed on quick-growing forages between hurdles. This constitutes an intensive method of handling and results in rapid growth, high finish and altogether a very superior mutton product.

Farm flocks are usually kept in regions where the climate is variable and hence special provision has to be made for feeding in winter and for sheltering in rainy and cold weather. Stored grain and roughages must be provided for. Of the grains, oats, corn, kaffir, barley and speltz are all suitable, but everything considered, oats are regarded the best for all but fattening sheep. The legume hays such as clover, alfalfa and soy beans are the best roughages, but good use can be made of corn silage and corn stover. In fact corn silage supplements splendidly with the legume hays. Some use can be made of oat and wheat straw as roughages, but they should be used in connection with the legume hays.

In northern United States, Canada and Great Britain, roots, such as Swedish turnips and Mangel wurtzels, are extensively used as feed for sheep. Being succulent they are valuable as a supplement to grain and hay.

Sheep require shelter chiefly as a protection from precipitous weather. Exposure to cold rains is especially damaging to them, particu-

larly if their wool becomes wet to the skin. Shelter is also needed if the weather is cold when the lambs are born.

Lambs are decidedly more popular than sheep as a meat product in the United States. The lambs are sold when they are from 4 to 10 months old and at live weights ranging from 65 to 90 pounds. Lambs are popular because they are toothsome and yield the size of chops and roasts most desired by American consumers.

From the standpoint of numbers and improved methods of breeding and feeding, the leading sheep countries of the world are Australia, New Zealand, United States, Argentine, South Africa and Great Britain. There are a great many sheep in Europe and Asia, but outside of a few European countries they are not well improved.

Dean, Department of Agriculture, University of Minnesota.

SHEEP, Mountain, a general term for the wild sheep of the world, which collectively form a group of romantic interest, and scientific importance. Excepting their perpetual rivals, the wild goats and ibexes, they are, of all land animals, the boldest and most active rock climbers, and the most partial to mountain scenery. Wherever found, they inhabit the highest and most rugged and picturesque situations. Strange as it may appear, the haunts of the Rocky Mountain big-horn include not only our loftiest mountain ranges and many wild tracts of "bad lands," but also the rocky walls of the great abyss known as the Grand Cañon of the Colorado. It is not strange, therefore, that all big-game hunters who love grand scenery find great fascination in the chase of wild sheep. No man worthy of the name of sportsman ever kills a ewe, but the head of an old ram, adorned with massive circling horns, won by dangerous mountain climbing and fair stalking, is a trophy of which any man may justly be proud.

It seems highly probable that the first wild sheep were developed in south-central Asia, in the region of the Altai Mountains, western Mongolia. At all events, the favorable conditions there obtaining have developed the great Siberian argali (*Ovis ammon*), whose enormous horns are a perpetual wonder to all who behold them. Near by in the Siar Mountains is found the Siar mountain-sheep. A comparatively short distance southward in Tibet is the Marco Polo sheep (*Ovis poli*), characterized by the enormous spread of its horns. A pair of horns of *Ovis poli* owned by Lord Roberts had a spread between tips of 54½ inches, and the longest horn measures 75 inches in length on the front curve. Southward of the range of the *Ovis poli,* in northern India, occurs the Punjab wild sheep, and the beautiful burrhel or blue sheep, both of them small species. Southwestward of Asia only two wild sheep are found, the small but handsomely colored mouflon of Corsica and Sardinia, and the large Barbary wild sheep or aoudad of the mountains of the Barbary states of North Africa. Northward from the home of *Ovis ammon* we find the Kamchatkan sheep, a species with horns like our white sheep, but otherwise exhibiting a strong resemblance to our big-horn. And this brings us to Bering Strait.

North America contains a really fine series of mountain-sheep species almost covering the mountainous regions of Alaska, and extending down the Rocky Mountain system to the region of Lake Santa Maria (lat. 30°) in northern Mexico. In addition to this, a species known as Nelson's mountain sheep branches off in southwestern Nevada, extends through southern California and on down the peninsula of Lower California for two-thirds of its length. The total area of North America inhabited by mountain sheep is about 3,500 miles long from north to south, and its greatest width from east to west, which is found in Alaska, is more than 1,000 miles. Of North American mountain-sheep, there are three conspicuous and well-marked types, and three offshoots. When diagrammed in a manner calculated to appeal to the eyes they stand as follows:

TYPES	OFFSHOOTS
Big-Horn (*Ovis canadensis*)	Nelson's Sheep (*Ovis nelsoni*) Mexican Sheep (*Ovis mexicanus*)
Black Sheep	(*Ovis stonei*)
White Sheep (*Ovis dalli*)	Fannin's Sheep (*Ovis fannini*).

The Rocky Mountain big-horn (q.v.) has been known since 1803, and is our most widely known species. All the others are of recent appearance, only the white sheep dating back as far as 1884. The range of the big-horn extends from lat. 55° and long. 120° to San Francisco Mountain, Arizona. It embraces the whole main range of the Rockies between those points,

and also includes the Fraser River country, one locality in northern Washington, two in eastern Oregon, the counties of Custer and Dawson in Montana, the Black Hills and Bighorn Mountains of Wyoming, four localities in Utah, and the Grand Cañon of the Colorado.

This is the largest and heaviest species of our *Ovis,* and carries the most massive horns. It reaches its maximum development in the main range of the Rocky Mountains in western Alberta. A large ram stands 40 inches in height at the shoulders and weighs about 325 pounds. Horns that measure 16 inches in basal circumference may justly be called very large. The largest and longest on record measured 18½ inches in basal circumference, and 52½ inches in length on outer curve, but the genuineness of this pair of horns is now doubted. One of the largest pairs in existence measures 16½ inches in basal circumference, 40½ inches in length and weighs 38 pounds. Apparently the horns of a mountain-sheep grow as long as the wearer survives in a healthy condition.

Wild sheep are not covered with wool like domestic sheep. Next to the skin is a coat of fine woolly hair, which is for warmth; but through this grows a coat of long, coarse hairs, large in diameter, pithy within and easily broken. This does duty as a rain-coat, and it also gives the animal its distinctive color. In summer, or late spring, when the old pelage is shed, the new coat is only half an inch in length, and the wild sheep stands forth fully sheared by the hand of nature. At that season the skin is worthless as a trophy. Mountain-sheep are at their best in October, November and December, and should be hunted at no other time. The lambs are born in May, and usually there is but one at a birth. Owing to the practical impossibility of keeping mountain-sheep of any American species alive in captivity, anywhere east of the Great Plains until they reach full maturity, our members of the genus *Ovis* are but little known to the general public, and consequently are quite unappreciated at their true value.

The white mountain-sheep of Alaska was not introduced to the world until 1884. It inhabits nearly all the mountainous regions of Alaska except the Alaska Peninsula, the valley of the Kuskoquim and the lower valley of the Yukon. Until recently it has been quite abundant on the Kenai Peninsula and around the head of Cook Inlet. This animal is all over pure white, and its winter pelage is long and abundant. It is smaller than the big-horn, and its horns never exceed 15½ inches in circumference. Northward its range extends almost to the Arctic Ocean, and its southern limit is found at lat. 58°. In 1901, the New York Zoological Society sent a collector to Cook Inlet to capture newly-born lambs of this species, and bring them to New York, for acclimatization in the Zoological Park. Three lambs were captured, but they proved to be such delicate feeders that all died within a few days of their capture.

The black mountain-sheep was discovered in 1896 in northern British Columbia, and good representatives of this species are to be seen in the museums of New York, Chicago and Washington. The size of the black sheep is the same as that of *Ovis dalli.* The species is characterized by the wide spread of its horns, and the very dark color of its pelage, all except the white of the rump-patch and the abdomen. So far as known the range of this species is very circumscribed, for it has not been reported outside of a small area in northern British Columbia.

Fannin's mountain-sheep, often called the "saddle-backed sheep," was discovered on the Klondike River near Dawson City in 1900. It is an offshoot of the white sheep, and may possibly be the result of cross-breeding between that species and the black sheep. Its back, sides and tail are bluish gray, and a brown band extends down the front of each leg; but all other parts of the animal are pure white. Its horns are like those of the white sheep. But little is known of the range of this species.

The Mexican sheep and Nelson's sheep are both offshoots of the big-horn. They are short-haired and large-horned, and their prevailing color is pale salmon gray.

Wherever they are not fully protected by law, all species of American mountain-sheep are sought for and killed, by hunters for sport, and by natives for food. The total number remaining is small, and it is impossible for the survivors to be protected too rigidly. The big-horn quickly learns the value of protection, and the herd in the Yellowstone Park has rapidly increased and become so tame that it permits visitors to approach within 30 paces. SHEEP-BOT, a bot-fly (q.v.) whose maggots produce the disease of sheep called "grub in the head." See Bot-Fly.

SHEEP-DOG. See Collie; Dog.

SHEEP-EATERS. See Shoshonean Indians.

SHEEP-LAUREL, or **LAMB-KILL,** the *Kalmia* or mountain-laurel (q.v.), which is poisonous to lambs and other small animals.

SHEEP TICK. See Ticks and Mites.

SHEEPSHEAD, the name of an important food fish (*Archosargus probatocephalus*) of the family *Sparidæ.* It is a stout, deep-bodied fish, with seven or eight vertical dark bands, and may attain a length of 2½ feet and a weight of 15 pounds. It receives its name from the resemblance of its teeth to those of a sheep, having incisor-like ones in the front of the mouth and molars behind. It is found along the coast from Cape Cod to Texas and is abundant locally and especially southward wherever the conditions are favorable. Like the drumfish, the sheepshead feeds chiefly upon hard-shelled mollusks and crustaceans, and large numbers congregate where such food is

plentiful and often prove destructive to oyster-beds. For boiling and similar methods of cooking it is considered superior to any fish in our waters, and consequently has a considerable commercial importance. The sheepshead is also a great favorite with anglers, many of whom are attracted to Florida fishing grounds in its pursuit. They are captured on extra stout lines and hooks baited with clam or soft-shelled crab and usually make a gallant fight before being finally landed in the boat. The freshwater drumfish is also called sheepshead.

Consult Jordan, David Starr, *American Food and Game Fishes* (1902); LaGorce, J. O., *The Book of Fishes, National Geographic Society* (Washington, D.C., 1952).

SHEERNESS, shēr-nĕs, urban district, England, County of Kent, on the Medway River where it joins the Thames, 35 miles southeast of London. It is strongly fortified and has an excellent harbor. There are spacious dockyards, used for making repairs, and which employ very many hands. The barracks accommodate several thousand soldiers and sailors. Sheerness-on-Sea is the modern town bordering the shore; the other divisions are Marinetown (a summer bathing resort), Miletown and Bankstown. Sheerness has a fine beach, broad esplanades and splendid bathing and boating. Charles II established the first dockyard here. In 1667 the town was captured by the Dutch admiral De Puyster. Pop. (1951) 15,727.

SHEERS, an engine used for hoisting masts and spars in shipbuilding and rigging. It consists of two or more poles or spars fastened together near the top and having their lower ends apart, somewhat in the shape of a narrow A. The apparatus is raised on a slant and is steadied by guy ropes, the base being fastened to the dock or ship on which it is used. From the top depends the tackle necessary for hoisting. Sheers are used on ships, docks and about shipyards for lifting heavy weights, guns, boilers or other machinery, spars and masts. When a mast is to be stepped or to be taken out, the sheers are mounted straddling the ship with the two base ends lashed to the deck on either side and the whole structure slanting so that its top is over the mast to be lifted or over the place into which it is to be dropped.

SHEET, generally speaking, a broad, flat surface; specifically a large stretch of water or ice; a large flat portion of some substance whose thickness is insignificant compared to its length and breadth, as a sheet of metal, of cardboard, etc.; a large rectangular piece of linen or like material used to cover the body during sleep, and thus a portion of the clothing of a bed; as applied to stationery, a large piece of paper either folded or unfolded; nautical, a sail, also the rope attached to the clew of a sail. As applied to paper, sheets follow two nomenclatures. Blank sheets of the stationers' trade are known by arbitrary names given to certain sizes, such as cap, legal cap, royal, demi-royal. But printed sheets are denoted, as to size, by an ancient system of Latin nomenclature, based on the number of folds required to bring to that size a sheet of certain dimensions. Thus a quarto is a sheet made of four folds, an octavo of eight, a duodecimo of 12, etc. (See Book.) From this idea of a folded, printed piece of paper a newspaper is often called a sheet, so, also, the leaves of books before bound, when the book is said to be "in sheets." A sail is called a sheet because it is made from a sheet of canvas and because it is broad, flat and thin. The rope called a sheet (abbreviated from sheet-rope) is used to hold a sail tight, or to haul it around and change its position.

SHEFFIELD, James Rockwell, American diplomat: b. Dubuque, Ia., Aug. 13, 1864; d. Saranac Lake, N. Y., Sept. 2, 1938. He graduated from Yale University in 1887, and from the Harvard Law School in 1889. Engaging in practise in New York City, he became, within a few years, one of its foremost advocates. He was interested also in politics, and served in 1893 as a member of the state assembly. In 1896 he became president of the board of fire commissioners of New York City. He was appointed ambassador to Mexico in 1924, and served during the period of friction between the United States and Mexico over the question of oil lands. He resigned in 1927. He was a trustee of the Carnegie Endowment for Industrial Peace.

SHEFFIELD, shĕf'ēld, **Joseph Earl,** American merchant and philanthropist: b. Southport, Conn., June 19, 1793; d. New Haven, Conn., Feb. 16, 1882. In 1813 he became a partner in a New York mercantile house, but subsequently removed to Mobile, Ala., where he acquired large interests in the cotton trade. From 1835 he was resident at New Haven, where he helped to obtain the charter for the New York and New Haven Railway, visiting London to secure the co-operation of capitalists. He also built the Chicago and Rock Island line. By his gifts and bequests of more than $950,000 the scientific department of Yale, since known as the Sheffield Scientific School, was reorganized and enlarged.

SHEFFIELD, city, Alabama, in Colbert County, on the Tennessee River; on the Louisville and Nashville; the Southern; and the Northern Alabama railroads; by rail, 84 miles south of Nashville, Tenn.; airport, with airline service. Sheffield, Florence, and Tuscumbia, the county seat, form the core of the Muscle Shoals region. Within a few miles on either side are the Guntersville, Wheeler, Wilson, and Pickwick Landing dams, sources of hydroelectric energy. The surrounding region has deposits of iron ore, limestone, phosphate, bauxite, rock asphalt, and clays. Sheffield has TVA fertilizer works and many large industrial plants.

Founded in 1883, the city was incorporated in 1885, and has the commission form of government. Pop. (1950) 10,767.

SHEFFIELD, city, England, in the county of York, West Riding, at the junction of the Sheaf and the Don rivers, on several slopes surrounded by wooded hills. The suburbs are attractively built, with many terraces and elegant residences. There are a great number of churches, chief of which is the parish church erected under the reign of Henry I, which contains some interesting monuments; St. Paul's, a good specimen of the Grecian; St. James'; St. George's; St. Philip's and St. Mary's, having exterior ornamentations of gargoyles, etc., and a graceful interior with a lofty and richly groined roof. The other buildings include the town hall, council hall and municipal offices, Corn Exchange, Norfolk Market, Theatre Royal, Athenaeum, libraries, association

halls, Mechanics' Institute, Albert Hall, Music Hall, Saint George's Museum, the Mappin Art Gallery and various others. The barracks are surrounded by extensive grounds. There are numerous hospitals and several monuments. Of educational and literary institutions the principal are Firth College; Wesley Ranmoor Methodist and People's College; grammar-school, public schools, art school, technical school; literary and philosophical institutions and museums. The University of Sheffield was founded in 1905 and is attended by over 2,125 students. The town enjoys all modern improvements. There are extensive botanical gardens. The Sheffield cutlery is celebrated, and all its manufactures of steel are famous, including heavy steel branches, such as armor plates, rail, large castings for engines, steel for rifles, etc. The other industries include the manufacture of optical instruments, iron and brass foundries, various mills, etc., besides silver plating, bicycles, cabinet-work, tanning, etc. Sheffield was in early times a Roman station and was an incorporated town under the Anglo-Saxons. In the 14th century it was already noted for its cutlery. Its history is also connected with the persecutions in the Netherlands, having been the refuge of victims suffering persecution under the Duke of Alva, who introduced their mechanical skill into the country. It developed rapidly in the 19th century, and became one of the greatest manufacturing cities of England. It was the first city of England to operate its street railway system. The electric-lighting and power plant, markets, artisans' dwellings, baths, free libraries, are also owned by the municipality. It sends five members to Parliament. Pop. 518,200. Consult Gatty, 'Sheffield, Past and Present' (London 1873).

SHEFFIELD PLATE. Of late years there has been a great interest in old Sheffield plate, which is now practically a lost art. Collectors pay large sums for specimens, which, a couple of decades ago, could be purchased for the proverbial «song.» Some connoisseurs prefer the peculiar lustrous quality that the mixture of copper and silver gives to silver itself; others are charmed by the models produced in this special ware. Notwithstanding the fact that many old families possess a few specimens of Sheffield plate, comparatively few persons know much about it, for the question has been little studied. At the present moment the collecting of Sheffield Plate has become something of a fad and «antique» shops tempt the buyer with real and spurious articles.

Old Sheffield Plate is a term used to describe articles of flat or hollow ware for table or domestic use made of copper coated with silver by fusion. In Sheffield Plated Ware the silver was laid on both sides of a sheet of copper, something like a sandwich with the copper in the middle, and the two metals, united by fusion, were then hardened by pressure between rollers. Hence its old name of «Copper Rolled Plate,» which describes it exactly. Sheffield Plate appears as a new invention in England in the year 1742; but it is more than likely it was a rediscovered process, for the art of imitating silver had reached a state of excellence in the 15th century. The art of imitating gold and silver was known to ancient nations. Assyrians, Egyptians and Hebrews were most skilful in the use of metals and in fine wire-work. The Romans left definite instructions regarding the application of gold and silver to articles of tin or copper and copper vessels coated with silver have been found at Herculaneum. The ancient Mexicans and Peruvians also made imitations of gold and silver and articles have been found in Peru that are silver plated on copper by a process very like that of Sheffield plating — the two metals having been amalgamated by heat. Sheffield Plate, or, to speak more correctly, Sheffield Plated Ware, dates from about 1743 and lasted for 100 years until it was superseded by electroplating about 1840. Sheffield in the reign of Queen Elizabeth was famed for its cutlery and also the fine parks, gardens and country-seats in its vicinity. Sheffield is now a place full of dirt and smoke, caused by the factories and iron and steel works. In 1742 Thomas Bolsover, a mechanic, was repairing the handle of a knife, which was composed partly of silver and partly of copper, when he accidentally fused the two metals. This showed him that it was possible to coat copper with silver in such a way as to form a cheap and durable metal presenting an exterior of silver only. He immediately began to manufacture articles of this kind (copper plated with silver), but he confined his efforts to small objects, such as buttons, snuff-boxes and other light and small articles. Then Joseph Hancock took up the business and began to imitate the finest and most richly embossed plate. Thus every kind of domestic article that had decorated the sideboard and buffet, which until then had been made of wrought silver only, was imitated in copper Rolled Plate.

Naturally, the new process was hailed with delight by the middle class, for it was possible now for people of ordinary means to have shining Sheffield Plated Ware who had heretofore contented themselves with pewter. The trade developed to such an extent that it was difficult to fill the orders that came from all parts of England and her colonies. The new process was also carried to Birmingham, London, Nottingham, Scotland and Ireland. Dublin became quite a centre for the new manufacture. Sheffield plate was also made in America.

The Sheffield manufacturers produced tea-urns, coffee and tea-pots, tea-kettles and lamps, epergnes, tankards and measures of all sizes, jugs, cups, goblets, tumblers, candlesticks, candelabra with branches, cruet frames, water and platter plates and dishes, dish-rims, crosses, tea-trays and waiters, bottle-stands, writing-stands, tureens, ladles, spoons, scallop-shells, canisters, mustard-pots, argyles, snuffer-trays, wine-funnels (round and oval), salt-cellars, bottle-labels, decanter-labels, cream-labels, bread and sugar baskets, skewers, lemon-strainers, cheese-toasters, chocolate pots, saucepans, stewpans, snuff-boxes, bridle bits, stirrups, buckets, spurs, knife and fork handles, buttons for saddles and many other small articles.

Horace Walpole, writing in 1760, says: «As I went to Lord Stafford's I passed through Sheffield. One man there has discovered the art of plating copper with silver. I bought a pair of candlesticks for two guineas; they are quite pretty.» Classification is difficult because the dealers have, unfortunately, divided up Sheffield in a way rather misleading to the

historian and art-critic. Dealers have named the first examples of Sheffield «Queen Anne,» which is absurd, because Sheffield plated ware began in the reign of George II. However, as dealers' names appear in catalogues of auction sales, etc., it is well to understand that what they mean by Queen Anne is applied to designs of the Queen Anne type, rather short and squat models in which the gadroon is the chief ornament. Dealers divide Sheffield plated ware into five periods: (1) Queen Anne; (2) early Georgian; (3) late Georgian; (4) Empire; and (5) Late. Sheffield Plated Ware followed all the styles that the silversmith introduced. Consequently the early and late Georgian show Louis XV and Chippendale styles and Louis XVI designs. The third period, from 1770 to 1785, is the most attractive of all because of the delicate and slender oval and the charming style of Adam, Heppelwhite and Sheraton ornamentation. Next comes the Empire style; and, finally, the last period, which is ornate and florid; but not by any means to be despised, because very splendid things were produced. The wire-work dates from 1790 to 1810. The perforated pieces come later. As a rule, the borders are of solid silver. In the earliest pieces the edge consists of a solid silver thread, or several threads; then comes the gadroon (or fluted) edge; then the gadroon and shell; and then the florid. Sheffield Plated Ware was often beautifully engraved.

Collectors should notice the difference between «Old Sheffield Plated Ware» which is silver-plated copper, and modern Sheffield Plated Ware, which is copper electro-plated. Counterfeit articles are made of copper and electro-plated.

Two or three points form a good test of the genuineness of old Sheffield Plate. One is the presence of embossed relief work of solid silver on all ornamented articles. Another test is the bands or narrow strips of silver to be found wrapped round the edges and under the mounts, which are put there to conceal the joints and bare edges of the copper. Another reliable test is the inlaid shield.

Nothing was hall-marked until 1784. Manufacturers also had special devices, viz., W. and G. Sissons, a bell; Watson, an open hand; Fenton Creswick and Company, crossed arrows; Boulton Bingham, ball and horseshoe; Walker Knowles and Company, ball and cross; Daniel Hoyle and Company, pineapple; Wilkinson and Company, cross keys, and so on. The chief authority is Bradbury's 'History of Old Sheffield Plate' (1912). Consult also Veitch, H. N., 'Sheffield Plate' (1908); Burgess, F. W., 'Silver: Pewter: Sheffield Plate' (1921); Okie, H. P., 'Old Silver and Old Sheffield Plate' (1928).

ESTHER SINGLETON.

SHEFFIELD SCIENTIFIC SCHOOL, a department of Yale University. See YALE UNIVERSITY.

SHEIK, shēk, an Arabic word signifying an aged man or elder, is used generally as a title of reverence and has come to acquire a great variety of significations. Among the Bedouins and other migratory tribes where patriarchal government prevails, the head of every tribe is called a sheik. The superiors of the Mohammedan religious or monastic orders are called sheiks. The chief mufti is called sheik-ul-islam. In general the title is given to learned men, and by a wider extension is used as a common title of courtesy, like Mr.

SHEIL, shēl, **Richard Lalor,** Irish orator, dramatist and politician: b. Drumdowney, 17 Aug. 1791; d. Florence, Italy, 25 May 1851. He was educated at Stonyhurst College and Trinity College, Dublin, studied law at Lincoln's Inn and was called to the bar in 1814. His progress in his practice was slow and he turned to dramatic writing, having already produced a moderately successful drama, 'Adelaide' (1814). A tragedy, 'The Apostate,' was produced in 1817, and ran through the season. He produced 'Bellamira, or the Fall of Tunis' (1818); 'Evadne' (1819); 'The Huguenot' (1822), and with John Banim, 'Damon and Pythias.' Of these 'Evadne' is considered the best. He next joined with Curran in contributing to the *New Monthly Magazine* the 'Sketches of the Irish Bar.' In 1825 he visited London with O'Connell, O'Gorman and others to protest against the bill that had been introduced for the suppression of the Catholic Association, and during the progress of the agitation continuing until 1829 spoke many times in public meetings in Ireland in behalf of the Irish cause. When emancipation was finally secured, Sheil moved the dissolution of the Catholic Association. In 1830 he entered Parliament from Milbourne Port in Dorset, sat for County Louth in 1831 and in 1833 was member of the first reformed Parliament for County Tipperary. He gradually withdrew from a close identification with the Irish cause and turned his attention more to the foreign policies of the empire. Shortly after the accession of William IV he became commissioner of Greenwich Hospital, but later exchanged this post for the vice-presidency of the Board of Trade. In 1846 he was appointed master of the mint and his inability to move in the relief of the famine in Ireland, though not thoroughly understood in that country, yet diminished his popularity. His last appointment was that of Minister to the court of Tuscany in 1850. He was brilliant in Parliamentary speaking, though he lacked spontaneousness, and carefully prepared each address. Of his forensic speeches that delivered as counsel for John O'Connell at the «monster trials» in Dublin in 1844 is accounted his best. His 'Speeches' was edited by McNevin (Dublin 1845). Consult McCullagh, W. T., 'Memoirs of Richard Lalor Sheil' (London 1855).

SHEKEL, a unit of weight supposed to have been first used in Babylonia and afterward by the Jews and other peoples; also a coin used by the Jews and thought to have been introduced by Simon Maccabæus. The weight was reckoned as one-sixtieth part of a maneh, and afterward was revised by the Phœnicians to be one-fiftieth part of a maneh (then called mina). It is probable that the shekel, with other measures of weight, underwent much revision as to size, shape and weight. Phœnician shekels are found in the following weights: 234 grains (Troy), 224 grains, 218 grains, 208 grains. The Assyrian shekel was of 129 grains; their double shekel of 258 grains. The Jewish shekel was of 218 grains.

The use of the shekel as money among the ancient Hebrews is popularly supposed to date with Simon Maccabæus, to whom was given

(1 Mac. xv, 5) the power "to coin money for thy country with thine own stamp." Whether or not Simon made use of this privilege is disputed by some authorities, but it is generally conceded that either he or his son coined the first native Hebrew money. This was about 141 B.C. The shekel seems to have been of gold, copper or silver, and originally of a shekel in weight. The gold shekel was worth about $5.69, the copper about three cents and the silver shekel about 54 cents. The silver shekel seems to have been the most used. A common example of it shows on one side a pot of manna, or sacred bread, with the legend "shekel of Israel"; on the reverse a flower figure, supposed to have been a representation of Aaron's rod budding, and the legend "Jerusalem the holy." The shekel of the sanctuary (Ex. xxx, 13) or temple tax was supposed, for a long period, to have been a special coinage, but it is now believed to have been the silver shekel of the country. Consult article "Money" in Hastings' 'Bible Dictionary' (New York 1900); Madden, F. W., 'Coins of the Jews' (London 1881); Reinach, T., 'Jewish Coins' (1903).

SHEKINAH, shē-kī'na, a post-Biblical abstract term, signifying "he who dwells," from the Biblical *Shakan,* to dwell, employed as a substitute for God to avoid certain anthropomorphic words in the Bible. It is used particularly in such passages where God is mentioned as dwelling either in the tabernacle or among the people, to express the majesty of the divine presence. It was used primarily to soften terms applied to God and to prevent by a kind of periphrasis false views as to His manifestations in the popular mind. At the root of its employment was the innate antagonism of the Israelite to any materialistic conception of the divine. It is found most frequently in the Targumim or Aramaic paraphrases of the Old Testament, written when Hebrew had ceased to be the popular language.

A few illustrations will make the usage clear. The Targum of Onkelos renders the sentence (Ex. xxix, 45) "And I will dwell among the children of Israel and be their God," as "And I will cause my Shekinah to dwell." In Isaiah (xxxiii, 17), "thine eyes shall see the King in all His beauty" became "Thine eyes shall see the Shekinah of the King of the worlds in His beauty." Onkelos translates "Elohim" in Gen. ix, 27 by "Shekinah" or whenever the person, dwelling, radiant majesty of the divine is mentioned. Even the temple of Solomon is called "the house of the Shekinah," which also took the place and meaning of the Aramaic *Memra* "name," *logos* and *Yekara,* "glory" in Talmud and Midrash. It is employed, too, in the New Testament — the Greek word for "glory" *doxa* being regarded as equivalent to Shekinah. G. H. Box gives as the most notable passage Romans, ix, 7, where Paul, mentioning the privileges of Israel, states "whose is the adoption and the glory," the visible presence or Shekinah of God among His people.

As to the nature of the word, it sprang into usage in a polemical era. Rabbinical opinions have not been unanimous. Schechter seems to regard as unfortunate the attempts of the rabbis to allegorize in the days of other than more aggressive philosophies. «What to the rabbis was a simple adjective, a reverential expression, or a poetical metaphor turned into the hands of the Hellenists into a new deity an aeon, or a distinct Emanation,» as he writes in 'Some Aspects of Rabbinic Theology' (p. 43). In later centuries Maimonides in his 'Guide to the Perplexed,' which sought to interpret the law of Moses by the logic of Aristotle or to coordinate both philosophies, considered the Shekinah as a distinct entity, a light proved to be intermediary between God and the world. On the other hand, Nachmanides deemed it the essence of God manifested in a distinct form. An attempt has been made by Weber to differentiate the Talmudic from the Targumic conception of the Shekinah but without success. The difficulty of an exact definition is due not only to the fact that diverse ideas have been associated with it, but to the circumstance that in rabbinical literature, extending over many centuries, the utmost freedom of opinion is exercised and full citations must be given to understand aright their views. In their homiletical interpretations in particular the rabbis were rich and naïve in fancy.

ABRAM S. ISAACS.

SHELBURNE, shĕl'bėrn, **William Petty Fitzmaurice,** LORD, 1st Marquis of Lansdowne: b. Dublin, 20 May 1737; d. London, 7 May 1805. He entered Oxford, but two years later left the university and entered the army. While engaged in the campaign in Germany he was returned to the House of Commons for High Wycombe in 1760, and was re-elected in the following year. He was also elected to the Irish Parliament, but he never sat in either body, for the death of his father in 1761 elevated him to the House of Lords. He was frequently employed by Butte as a negotiator in political combinations and on 30 April 1763 he became president of the Board of Trade and Foreign Plantations with a seat in the Cabinet; but his speech in the debate on the proceedings against Wilkes caused his dismissal from his staff appointment. In April 1764 he took his seat in the Irish House of Lords as Earl of Shelburne, and in 1766 took a leading part in the English Parliament in the repeal of the Stamp Act. Under Pitt he became Secretary of State for the Southern Department (23 July 1766), and in the following month the entire control of the administration of the colonies was placed in his hands. He endeavored to pursue a conciliatory policy toward the American colonies, but in this was thwarted by his colleagues, and in January 1768 was superseded by Lord Hillsborough. He stood alone with Chatham against coercing the American colonies, but his opposition was unavailing. In his Parliamentary speeches, many of which became famous, he always opposed the coercive measures of Lord North's ministry, recommended measures for ending the hostilities in America, but declared he would never consent to the acknowledgment of American independence. When Lord North resigned in March 1782 Shelburne declined the

king's invitation to form a new ministry, but acted as intermediary in pressing the post upon Rockingham. In the Cabinet formed by the latter he became Secretary of State for Home Affairs, and tried to introduce several economic reforms. Rockingham's death occurred in July of that year and Shelburne accepted the duty of forming a government. In this ministry William Pitt, then only 23, became Chancellor of the Exchequer. In the debate on the change of ministry Shelburne declared that he still adhered to all the constitutional ideas that he had imbibed from his master in politics, Lord Chatham, and that he had not altered his opinion concerning American independence; but during the negotiations of the Peace of Paris he was reluctantly led to agree to the concession. The coalition of North and Fox against his government led to his resignation 24 Feb. 1783. In December 1784 he became Marquis of Lansdowne in the English peerage. He was one of the most hated men of his time, a circumstance probably due to his independent spirit in party politics and his supercilious manners. Yet many of his views were more enlightened than his times. He advocated Parliamentary and economic reform, Catholic emancipation and religious equality and free trade. Disraeli said he was «the first great minister who comprehended the rising importance of the middle class.» He patronized literature and the fine arts and his later years were largely devoted to his collection of books and pictures. Consult Fitzgerald, 'Fitzmaurice, Life of William, Earl of Shelburne' (1875–76; revised ed., London 1912).

SHELBURNE, Canada, capital of Shelburne County, Nova Scotia, a seaport town on the southwest coast at the head of a deep and capacious bay, forming one of the safest harbors of the province, 140 miles southwest of Halifax. Shelburne is a station on the Canadian National Railway and has an important maritime and transit trade. Ship repairing docks and ironworks are the chief industrial establishments, and its fisheries are valuable. The Roseway River supplies abundant waterpower. The entrance to the harbor is marked by a lighthouse on McNutt's Island; it exhibits two lights, the highest 120 feet above the sea. After the American Revolution the population of Shelburne was increased to about 12,000 by the advent of United Empire Loyalists. Pop. (1951) 2,040.

SHELBY, Isaac, American soldier; b. North Mountain, Md., 11 Dec. 1750; d. Traveller's Rest, Lincoln County, Ky., 18 July 1826. He became a surveyor and in 1771 removed to Tennessee. In 1774 he was appointed lieutenant in the company of his father, Gen. Evan Shelby, fought at the battle of Point Pleasant and remained in command of the fort there until 1775. He was engaged at the battle of Long Island flats where his valor won the day, became commissary of the frontier in 1777 with rank as captain, in the succeeding year was promoted colonel, and also served as a member of the Virginia house of delegates in that year. He planned the important action at King's Mountain in 1780, served under Marion in 1781 and under Greene in 1781–82, and was a member of the North Carolina legislature in those years. He was a member of the Constitutional Convention in 1791 and was elected the first governor of Kentucky in 1792, served until 1796 and again in 1812–16. He recruited and led 4,000 men to the relief of General Harrison in Canada in the War of 1812, receiving a gold medal from Congress for his services. He declined the office of Secretary of War in 1817 and afterward lived in retirement, though he acted as commissioner with General Jackson in negotiating the treaty with the Chickasaw Indians in 1818. Nine counties in the Southern and Western states are named in his honor, as is also a college at Shelbyville, Ky.

SHELBY, city, North Carolina, and Cleveland County seat, altitude 1,000 feet; on the Southern, and Seaboard Air Line railroads, and state and federal highways. It is the center of a rich agricultural area, producing cotton, dairy products, fruit, and beef cattle. Its principal industries are textiles, hosiery manufacture, food processing, making of furniture, and fertilizer. The water and lights are municipally owned and operated. Government is by a mayor and four city councilmen. Pop. (1950) 15,508.

SHELBYVILLE, Ill., city and Shelby County seat, alt. 601 feet, on the Kaskaskia River; on the Chicago and Eastern Illinois and the New York Central railroads; by rail, 194m. SW. of Chicago. The city is a trading center for an agricultural region with a number of small towns, and its industries are principally connected with the processing of farm products. City government is by mayor and commissioners. Pop. (1950) 4,462.

SHELBYVILLE, Ind., city and Shelby County seat, alt. 768 feet, on the Big Blue River; on the Cleveland, Cincinnati, Chicago and St. Louis Railroad and (for freight service) the Pennsylvania Railroad; by rail, 27m. SE. of Indianapolis; airport, with airline service. The principal industrial products are fireless cookers, furniture, lawn mowers, gas ranges, overalls, and canned foods.

Shelbyville's civic organizations include a Carnegie library, a county museum, located in the courthouse, a music appreciation society, the William S. Major Hospital, and the Inlow Clinic. Laid out in 1822, Shelbyville was incorporated as a town in 1850 and was given its charter as a city in 1860. It has mayor and council. Pop. (1950) 11,734.

SHELBYVILLE, Ky., city and Shelby County seat, alt. 760 feet; on the Southern, the Louisville and Nashville, and the Chesapeake and Ohio railroads; by rail, 32m. E. of Louisville, 24m. W. of Frankfort. Surrounding the city is a region of agriculture and stock raising, with tobacco as a main crop. Corn, cereal grains, and alfalfa hay are also produced. In accord with the character of its environment, the city has flour and feed mills and tobacco warehouses. Shelbyville is rated as the second largest tobacco market in the state. Civic centers include a public library, several churches, and a hospital, the post office, and the courthouse. Founded in 1792, the town, like the county, was named in honor of Isaac Shelby (q.v.), first governor of Kentucky. Near by, Daniel Boone's brother built a fort, which in 1781 was abandoned by the settlers

who were attacked by the Indians while on their way to the fort at the Falls of the Ohio. Government is administered by mayor and council. Pop. (1950) 4,403.

SHELBYVILLE, town, Tennessee, and Bedford County seat, altitude 771 feet; on the Nashville, Chattanooga and St. Louis Railroad; by rail, 63 miles southeast of Nashville. Located on the Duck River, the town is a trading center for the valley, an agricultural region with some mineral deposits. Rubber goods, graphite, and pencils are its principal products. There are also knitting mills. In the 1920's industrial advancement brought rapid growth to this Tennessee town. Platted in 1810 and incorporated in 1819, Shelbyville was named for Col. Isaac Shelby, who fought at King's Mountain and became first governor of Kentucky. During the Civil War, Shelbyville was the scene of many skirmishes. The town's government is administered by mayor and council. Pop. (1950) 9,456.

SHELDON, shĕl'dŭn, **Charles Monroe,** American Congregational clergyman and author: b. Wellsville, N. Y., Feb. 26, 1857; d. Topeka, Kans., Feb. 24, 1946. He was graduated from Brown University in 1883, from the Andover Theological Seminary in 1886, and was ordained in 1886. In 1889 he became pastor of the Central Congregational Church of Topeka, Kans. In 1900 he attracted considerable attention by his connection with the Topeka *Capital* of which he took entire charge for one week, and which he published as a distinctively Christian daily after principles enunciated in his book, *In His Steps* (1896).

From 1920 to 1925 he was editor of the *Christian Herald,* and thereafter was contributing editor. Other volumes by him include *Richard Bruce* (1891); *Robert Hardy's Seven Days* (1892); *The Twentieth Door* (1893); *The Crucifixion of Philip Strong* (1893); *John King's Question Class* (1894); *His Brother's Keeper* (1895); *Malcolm Kirk* (1897); *Lend a Hand* (1897); *The Redemption of Freetown* (1898); *The Miracle at Markham* (1898); *One of the Two* (1898); *For Christ and the Church* (1899); *Edward Blake* (1899); *Born to Serve* (1900); *Who Killed Joe's Baby?* (1901); *The Wheels of the Machine* (1901); *The Reformer* (1902); *The Narrow Gate* (1902); *The Heart of the World* (1905); *Paul Douglas; The Good Fight* (1909); *Howard Chase* (1917); *A Little Book for Every Day* (1917); *All the World* (1918); *Heart Stories* (1920); *In His Steps Today* (1921); *The Richest Man in Kansas* (1921); dramatic version of *In His Steps* (1923); *The Everyday Bible* (1924); *Two Old Friends* (1925); *Charles M. Sheldon—His Life and Story* (1925); *Let's Talk It Over* (1929).

SHELDON, Edward Brewster, American dramatist: b. Chicago, Ill., Jan. 14, 1886; d. New York, N. Y., April 1, 1946. He was graduated at Harvard in 1907 and took his A.M. there in 1908. His first play *Salvation Nell* (1908), in which Mrs. Minnie Maddern Fiske starred, was written while pursuing postgraduate studies. His plays include: *The Nigger* (1909); *The Boss* (1912); *The High Road* (1912); *Romance* (1913); *The Song of Songs* (1914); *Garden of Paradise* (1915); *Bewitched* (1924); *Lulu Belle* (1926); and *Dishonored Lady* (1930).

SHELDON, Edward Stevens, American philologist: b. Waterville, Me., Nov. 21, 1851; d. Cambridge, Mass., Oct. 16, 1925. He was graduated at Harvard University, 1872, and later studied at Berlin, Paris and Leipzig. From 1877 he was connected with the modern languages and Romance philology departments at Harvard, and after 1894 was professor there.

SHELDON, Henry Clay, American Methodist Episcopal theologian and educator: b. Martinsburg, N. Y., Mar. 12, 1845; d. Aug. 4, 1928; graduated at Yale University in 1867 and at the Boston University School of Theology in 1871, was ordained and served as a pastor in 1871–1874. He was professor of historic theology at the Boston University School of Theology in 1875–1895, and thereafter was professor of systematic theology there. He was the author of *History of Christian Doctrine,* 2 vols. (1886; 4th ed., 1906); *Studies in Recent Adventism* (1915); *Theosophy and New Thought* (1916); *The Mystery Religions and the New Testament* (1918); *Pantheistic Dilemmas and Other Essays in Philosophy and Religion* (1920); *The Essentials of Christianity* (1922).

SHELDON, John Lewis, American botanist and bacteriologist: b. Voluntown, Conn., Nov. 10, 1865. He was graduated from Ohio Northern University, B.S., 1895, M.S., 1899, and from the University of Nebraska, B.S., 1899, A.M., 1901, and Ph.D., 1903. From 1885–1890 and again from 1895–1897 he taught in the public schools of Connecticut. In 1899–1900 he was acting head of the department of biology at the Nebraska State Normal School. He then returned to the University of Nebraska as instructor in botany, 1901–1903, and then went to West Virginia University as professor of bacteriology and bacteriologist at the Agricultural Experiment Station, 1903–1907, as professor of botany and bacteriology, 1907–1913, and as professor of botany, 1913–1919.

SHELDON, Samuel, American electrical engineer: b. Middlebury, Vt., 1862; d. Sept. 4, 1920. He was graduated at Middlebury College in 1885, and from the University of Wurzburg in 1888. He was assistant in physics at Harvard in 1888–1889, and from 1889 was professor of physics and electrical engineering at the Brooklyn Institute of Arts and Sciences. In 1903 he was appointed an expert in the Swiss department of justice and police. He was the author of *Dynamo Electric Machinery* (1900; 9th ed., 1915); and joint author of *Alternating Current Machines* (1902; 9th ed., 1911), and *Electric Traction and Transmission Engineering* (1911).

SHELDRAKE or **SHELD DRAKE,** a sea-duck (*Tadorna cornuta*) of the cooler parts of the Old World, which frequents sandy shores and makes its nest in burrows in sand-dunes, earthen cliffs, old rabbit-warrens, etc. It is of large size and very handsome plumage; head and upper neck dark, glossy green, broad white collar below, with a broader band of bright bay extending from the back across the breast. It is somewhat larger than an ordinary duck and the female is smaller and less brilliantly colored. In the Frisian Islands and some other parts of the world the people provide it with acceptable artificial breeding-burrows and take a portion of its eggs and down, so making an annual profit

from the arrangement. Several other species of the same genus are found throughout Africa, southeastern Asia and Malaya, one of which is well known in India as the Brahmany duck. Much interest attaches to these birds and the name itself is a matter of curious speculation.

SHELIA, Jebel. See CHELIA, DJEBEL.

SHELIFF. See CHELIFF.

SHELL, shĕl, the hard, protective covering of various forms of plants, especially nuts and seeds, and animals, such as turtles, the eggs of birds and reptiles, or the rigid "external skeleton" of some invertebrates, such as foraminifers, echinoderms, crustaceans, brachiopods, but especially of mollusks which include clams, snails, and other sea shells. This article is restricted to the shells of the Mollusca (q.v.), while the characteristic structures of other shells, tests, and exoskeletons are described under separate headings. (See CRUSTACEA; ECHINODERMATA; EGG.)

Shells are produced as hard, limy exoskeletons by the vast majority of the mollusks, although some shells may be internal as in the cuttlefish, squids, a few clams, and many opisthobranch sea slugs, or are entirely absent as in most land slugs and all nudibranch sea slugs. Sea shells are produced by five marine classes of mollusks: the gastropods (snails or univalves), the pelecypods (clams, mussels, oysters, or bivalves) and three minor groups, the scaphopods (tusk and tooth shells), the cephalopods (chambered nautilus), and amphineurans (chitons or coat of mail shells). It is estimated that about half of the 100,000 living species and forms of mollusks are from the seas, while the others are from freshwater habitats (such as river mussels and pond and aquarium snails) or from terrestrial habitats (garden snails and tree snails).

Structure and Growth of Shells.—The shell material is produced in the form of a liquid secretion mainly from glands located along the edge of the fleshy, capelike mantle, an organ common to all mollusks. The liquid calcium carbonate becomes crystallized to form additions to the hard shell when mixed with a colloidal albumen which is also produced by the mantle. Shell deposition is not continuous, but occurs periodically during the life of the animal, sometimes every few days, weeks, or even seasonally. Growth is generally inhibited during unfavorable environmental conditions, such as abnormally cold or dry weather, paucity of food, or during and just after breeding periods. A minor amount of shell material is produced by other regions of the mantle for the purpose of repairing cracks and holes or encasing foreign particles (see PEARL). The foot in gastropods secretes a hard, calcareous operculum or trapdoor.

Shell growth begins early in the development of the larval form of the mollusk, and in most snails the young already have two or three spiral shell whorls, known as nepionic or nuclear whorls, before they hatch from the egg capsule. In the young stages of many bivalves, the early free-swimming form, such as the spat, or young, of oysters, has two shelly valves which in a few days grow too large and heavy to permit further swimming. Additional growth occurs in clam shells along the free edge of the valve, and, in the case of snail shells, along the rim of the outer lip of the aperture. In the spiral forms of univalves, the shell may be thought of as a regularly increasing or expanding cone which is wound around an axis or the columella of the shell. The many different shapes of univalve shells are determined by genetic factors which, in turn, control the rate of expansion of the aperture, the degree and regularity of the plane in which the new whorls are added and, to a lesser degree, by the major modifications in sculpturing. Water currents, waves, food, temperature, and other outside conditions may influence growth during the lifetime of an individual.

The span of life and maximum age of marine species are very imperfectly known. Undoubtedly many species live for only two, three, or four years. The common European periwinkle (*Littorina littorea*) found in New England has been kept alive in captivity for twenty years. Large specimens of the horse conch, the queen conch (*Strombus gigas*) and the cameo king conch (*Cassis*) probably represent 10 to 25 years of growth. The nudibranch sea slugs are believed to be short-lived, and *Aeolis* and *Goniodoris* have been shown to survive only into the second year. It is believed that the giant clam (*Tridacna*) of the Indo-Pacific region lives for perhaps 100 years, but this has not been confirmed by experiments or accurate calculations. The average age of the Atlantic bay scallop is about 16 months, its maximum age only two or three years. The average age of a five-inch pismo clam on the Pacific coast is about eight years, its maximum age 25 years.

There are two fundamental types of sculpturing in spirally coiled gastropods: *spiral* and *axial*. The former is expressed as ridges, cords, threads, channels, and cut lines which all follow the direction of growth of the shell, while in axial sculpturing the formation of ribs, ridges, and varices is parallel to the edge of the growing lip. In the bivalves, sculptural features that parallel the growing edge of the valve are spoken of as *concentric*. Some mollusks may produce remarkably smooth shells that resemble highly glossed porcelain, while others make ornately sculptured or grossly spined shells.

Marine Shells.—The marine bivalves show remarkable diversity in shape and mode of life. Most, however, are sand dwellers and live just below the surface of the muddy sand where they keep in contact with food-laden ocean water by means of two fleshy, tubular siphons. In the Venus clams, the surf clams (*Mactridae*), and Lucine clams the siphons are very short, while in others, such as the common soft shelled clam (*Mya*) and the angel wing of Florida (*Barnea costata*) which live far below the surface, the siphons are encased in a very long muscular tube.

The oysters are without siphons or functional foot and remain attached to the hard substrate during adult life. The coon oyster lives among the branches of the mangrove trees of the tropics and is able to feed and breathe only during high tide. The distantly related thorny oysters (*Spondylus*) which live in fairly deep tropical waters are renowned for their vivid colors and long, delicate spines. Those from the Gulf of Mexico command high prices among shell collectors.

A number of bivalves have become specialized to the extent of making burrows in wood, compact clay, and soft stone. The elongate, brown date mussels (*Lithophaga*) secrete acid with which they etch out their homes in coral blocks. Their own shells are protected from the acid by

a tightly fitting jacket of horny periostracum. The shipworms (*Teredo* and *Bankia*) since time immemorial have plagued seafarers by destroying wooden plankings of ships, wharf pilings, and manila hemp lines. The animal of this clam resembles a long, white worm with the two cutting shells at one end and the siphons at the other. Strangest of the bivalves is the watering-pot shell (*Aspergillum*) of the East Indies and Indian Ocean, about six inches in length, which resembles the spout of a garden watering pot. The circular, swollen end of the calcareous tube is perforated with numerous small holes, and the only clamlike feature to the shell is two tiny valves on one side of the tube.

The ability to swim is rare among adult bivalves. Scallops (*Pecten*) include many species which can swim for several dozen feet at a time. The movement is accomplished by the rapid snapping of the two shelly valves. While the scallops always swim with their valves in a horizontal plane, the *Lima* file clams most frequently progress edgewise, that is, with the breadth of the valves vertical or slightly oblique. The long, colorful tentacles of the *Lima* keep the animal momentarily suspended in water while the valves are being opened in preparation for another "bite" forward. The *Lima* is a poor swimmer and, because of its habit of building nests under rocks, apparently has no incentive to undertake migrations as is done by schools of scallops.

Sea shells vary greatly in size; the adults of some tiny *Rissoa* snails never exceed $\frac{1}{32}$ of an inch, while the horse conch (*Pleuroploca gigantea*) of the lower Florida Keys may reach a length of two feet. Of equal size is the great spindle shell (*Megalotractus*) from the Great Barrier Reef off Australia. Among the marine clams, the amethyst, gem clam found in shallow, sand-bottomed bays of eastern United States, is one of the smallest bivalves, barely exceeding $\frac{1}{16}$ of an inch. The largest known living shelled mollusk is the giant clam (*Tridacna gigas*) of the tropical Indo-Pacific region. It may reach a length of four feet and a total weight of 500 pounds. Contrary to popular belief, it is not a man-eating clam, but lives upon single-celled seaweeds or algae which grow symbiotically within the tissues of its mantle. Apparently, there has been no authenticated record of its having trapped and drowned a human.

Perhaps the oddest of the marine snails are the carrier shells (*Xenophora*) which gather and attach to themselves other dead shells, bits of coral and stones. Viewed from above, the carrier shell resembles a pile of marine debris, and this peculiar habit is believed to be of camouflage or protective value to the animal. The animal holds the edge of its shell to the foreign object and secretes from the fleshy mantle liquid calcium carbonate which soon hardens to form the permanent attachment.

The four families of marine snails most sought after by collectors of sea shells are the cones (Conidae), cowries (Cypraeidae), volutes (Volutidae) and the olive shells (Olividae). The several hundred species of living cones are warm-water inhabitants, all of a standard inverted conic shape with little major variation in sculpture, but quite variable in their attractive color designs. Rarest of them is the famous glory of the seas cone from the East Indies and the Philippines. There are only two dozen known specimens, all exhibiting a graceful, smooth spire and intricate yellow and red color markings. Specimens of this cone in 1956 were valued at from $500 to $1,000, depending upon size and condition. Several species of cones from the Indo-Pacific region are known to inflict a sting that is fatal to man.

The shell of the cowrie, of which there are about 160 living species, is well-known for its highly glossed finish, smooth and rounded contours, and brightly hued color patterns. The small yellow money cowrie (*Cypraea moneta*) was for many centuries used as a form of money in Africa and southern Asia. It also played an important part in religious rites and was used as a symbol of fertility and life. The four-inch-long golden cowrie is a particularly choice collector's item because of its comparative rarity and unusual orange-cream color. It lives in the reefs of the Central Pacific from the Philippines to the Fiji Islands, but only in the latter area is it worn around the necks of native chiefs as a sign of high rank or royalty.

Collectors of fancy sea shells are constantly in search of specimens of outstanding qualities, and although a number of species are well-known for their high value or unusual beauty, the standards by which their rarity and attractiveness are judged are quite varied. For many conchologists rarity is gauged by the top price that a specimen may bring; for others the important judging point is the scarcity of the species in nature or perhaps the rarity of specimens in collections. Left-handed, double-mouthed, or distorted specimens, like misprints in stamps, are highly valued by many veteran collectors. There are literally hundreds of truly rare species, but most of these are deep-sea shells, some of which are known only from a single specimen. Most of these are small and not particularly attractive. The high-priced shells are found among the showy genera, like the cones, volutes, murex shells, scallops, and cowries. Some species may be considered rarities for years and command very high prices before they are collected in large quantities. The precious wentletrap (*Epitonium scalare*) of the West Pacific was in such demand years ago that Chinese traders found it profitable to make counterfeits out of rice paste. The species is now considered reasonably common and is low-priced, but genuine rice counterfeits are now rare and equal in value to the price of the first-known shell specimens.

Distribution.—Sea shells are found in every ocean, from the shoreline to the very deepest parts of the seas, and from the polar regions to the tropics. Each major area in the world has sea shells unique to its waters, although a few species, particularly those that live at the surface of the ocean, are worldwide in distribution. The geographic boundaries of past geologic oceans and environmental conditions, especially water temperature and salinity, have been responsible for the formation of these faunal and subfaunal regions.

Largest and richest of these regions is the Indo-Pacific, a vast, tropical marine area extending from the western shores of Africa, through the Indian Ocean to Japan, Australia, and the Polynesian Islands. The area is known for its richness in number of species, particularly among such groups as the cowries, cones, terebras, turbans, and venus clams. Some showy genera are unique to the Indo-Pacific, such as the spider conchs (*Lambis*), the chambered nautilus and the giant clams (*Tridacna*). Not all sections of the Indo-Pacific are excellent collecting grounds, either

because of excessive fresh water, muddy conditions, or because of lack of sufficient nitrogenous foods. The richest areas are along the east coast of Africa from Kenya to Mozambique, the section off the coast of Queensland, Australia, several small areas throughout the East Indies, the Philippines, and the Ryukyu Islands.

Second to the Indo-Pacific in attractive sea shells is the West Indian region which includes the Caribbean and the Antilles, from Bermuda to Florida and south to Brazil. Although not particularly rich in species, some genera possess large and attractive species, such as the triton trumpet (*Charonia*), the true conchs (*Strombus*), the helmet shells (*Cassis*), and the tulip shells (*Fasciolaria*). The wentletraps (*Epitoniidae*), Lucine Clams, and Marginellas are represented by numerous species.

The Mediterranean region is semitropical in nature and comparatively rich in species, about 2,000 in all being known. Generically it resembles the West Indian region. Other distinctive molluscan faunas are found in South Africa, the Patagonian region of South America, the tropical Pacific-Panamic area, the west coast of North America, and the New Zealand-Tasmanian region.

Freshwater Varieties.—Freshwater shells are represented by only two of the classes of mollusks, the snails and the clams. The estimated 10,000 species exhibit remarkable variation in shape and sculpture, ranging from the 14-inch-long river mussels of eastern China to the pinhead-sized Amnicolid snails of American lakes and ponds. They live in a variety of habitats, some occurring in hot springs, the bottom of very deep lakes, within caves, or at the foot of waterfalls, while others can survive in hot, temporary ponds and drainage ditches of the tropics or in the frozen ponds of the polar regions.

The principal families of freshwater snails are the Viviparidae, the large, operculated apple snails that are sometimes used in aquaria; the Thiaridae, worldwide and abundant, turret-shaped, operculated snails; the Hydrobiidae, small, coiled shells usually less than a half inch in size, some of which carry serious parasitic diseases in the Orient; the Planorbidae, a worldwide group of pulmonate pond snails to which belongs the familiar Red Ramshorn of home aquaria; the Lymnaeidae pond and lake snails, some of which in northern United States carry a parasitic disease known as swimmer's itch. The most conspicuous freshwater bivalves are the river mussels or unios of which there are several dozen genera found in the major watersheds of the world. Many of them are large and have an attractive, lustrous interior. In the Mississippi drainage, there are many large species which, before the advent of plastics, were the major source of pearl buttons.

Land Varieties.—Most of the land shells are pulmonate gastropods, that is, snails that have a modified lung, and they include the garden and woodland snails and the shell-less slugs. A few small species are gill-bearing, operculated prosobranch snails. Many of the land shells are as highly colored and as attractively designed as the most popular of the sea shells. Numerous species, reaching two or three inches in size, dwell among the branches of high trees, such as the Philippine *Obba, Helicostyla,* and *Amphidromus* snails and the brightly colored *Liguus* tree snails of southern Florida and Cuba. The *Polymita* bush snails of Oriente Province, Cuba, have the artificial appearance of having been painted in bright shades of red, orange, yellow, and black.

Largest of the land shells are the giant African snails of the genus *Achatina.* The largest species lives in the rain forests in the western part of French Equatorial Africa, and its shell reaches a length of eight inches, while the extended foot upon which the snail crawls may stretch to over 12 inches in length. This snail is roasted and eaten by the natives. About half as large is the giant east African snail (*Achatina fulica*) which after World War II caused considerable alarm among agriculturalists in many of the western Pacific islands because of the damage it caused to garden plants. This prolific snail was carried by man first to the island of Mauritius sometime before 1800, to India in 1857, to the East Indies prior to 1927, and was finally spread, mainly by the Japanese, to Formosa, the Ryukyu Islands, and Micronesia during the 1930's and 1940's. It is now established in the Hawaiian Islands, but as late as 1956 had not entered continental United States where, however, climatic conditions would not favor its survival.

The woodlands of North America contain many hundreds of interesting land shells most of which, however, are rather small and drab in color. The species inhabiting the mountainous areas are generally quite different from those living in the coastal regions, and a further faunal difference is evident between those of the western and eastern parts of the United States. Most of these snails prefer damp, shady areas where there is a certain degree of calcium carbonate in the soil and rocks. About 40 kinds of European snails and land slugs have been accidentally introduced into America, and of special note is one of the French edible snails (*Helix aspersa*) which is a considerable nuisance in California gardens.

Department of Mollusks, Academy of Natural Sciences, Philadelphia.

SHELL CAMEOS are the kind of cameos that are carved in bas-relief on specially chosen shells, in contrast to the commoner gem cameos which are engraved in bas-relief on precious or semi-precious stones like onyx. In shell cameo work the artist uses the shells of mollusks, conches and the like. These shells have a softer working surface than minerals, though their durability is much more limited. Even in antiquity artists made cameos by using shells on which they engraved either portraits or scenes from battle, hunting, or religious observance. The preferred shells were helmet-shaped mollusks and conches, such as the *black helmet,* the *horned helmet,* the *pink-queen's conch,* and the *pearly nautilus.* All these are shells in which layers of different colors occur, so that very beautiful effects are obtained by carving the artistic picture into one or more colored layers upon a ground with a contrasting color.

History.—It is believed that shell cameos originated in Mesopotamia and Egypt. Greek and Roman writers cursorily mention Egyptian and Babylonian specimens, which they ascribe to the 4th millennium B.C., but none of these have survived. Probably the earliest artistically carved

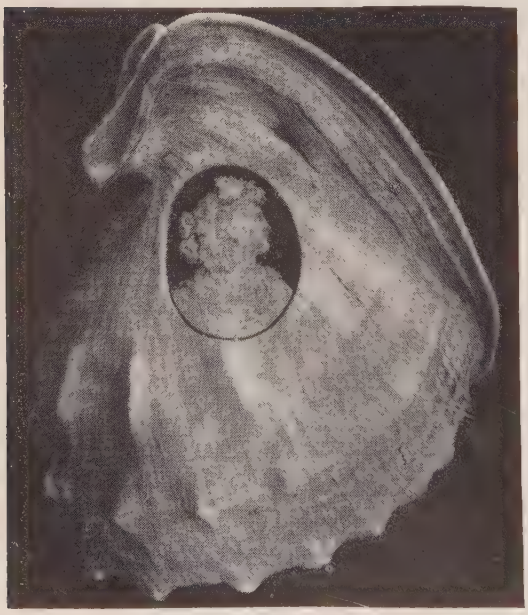
Shell cameos. *Left:* Guido Reni's "Aurora." *Right:* Phoebus in his chariot. Carved in Italy.

example known to us is the *Triducna Squamata* shell in the British Museum, London, said to be of Phoenician workmanship, 6th or 7th century B.C. In Greek and Roman times, shell cameos were well known in upper class circles, but only a few antique specimens have come down to us. This scarcity cannot with certainty be explained. Perhaps the costly shells were not in wide popular demand, or perhaps, if they were plentiful, they were discarded when the ravages of time marred their beauty and integrity.

When the Roman Empire disintegrated and all the fine arts died from neglect, the shell cameo art was no exception. Not until the Italian Renaissance was there a revival of interest in the cameo form of art objects. By the 16th century, the craft of shell cameo-making had again begun to flourish, both in the Italian and in the French and Flemish cities. Shell cameos continued to be made in Italy and France until the end of the 17th century, when the demand died out. Most 16th century shell cameos show some deterioration, but the world's leading museums contain a fair number of Renaissance examples. A majority of these cameo pictures are found on helmet-shaped conches, on pearly *Meleagrina* shells, and on the nautilus shell. The big helmet-like cameos were used to decorate libraries, and reception rooms. The smaller pearly cameos were tastefully framed and worn as wristbands, earrings and necklaces.



Courtesy The American Museum of Natural History

Cameo shell, or helmet shell. *Cassis madagascariensis.*

A cameo made from shells was perhaps too crudely elemental to suit the formal 18th century taste. Anyhow, the 18th century preferred gem cameos to the shell variety. The 19th century took to shells again and created a demand for them among the less opulent classes. For a time, shell cameos in the form of brooches, etc. became the fashion for personal adornment. The demand for the big, unframed shell cameos, popular in the Renaissance, was not revived. However, connoisseurs now began to collect the older shells, and this new hobby led to a startling rise in the price of the finest antique and Renaissance specimens. When the English Marlborough Collection was dispersed in 1899, a shell Laocoön cameo, cut by the famous Flamingo in the 17th century, sold for £335.

Examples.—New York has two splendid cameo collections, each containing a few rare examples of cameos cut from shells. The famous Morgan Collection is in the American Museum of Natural History, and the Milton Weil Collection, one of the world's finest, is in The Metropolitan Museum of Art. The Morgan Collection includes two wonderful Renaissance shells for interior display, one being a copy of Guido Reni's *Aurora,* cut on a Madagascar helmet shell, while the other, made of a similar shell, gives a picture of Actaeon surprising an angry Diana with her nymphs. The Milton Weil Collection, which is surpassed only by the great public collections in London, Paris,

and Vienna, contains eight rare shell cameos from the 16th, 17th and 19th centuries. The eight specimens include a wristband, earrings, a necklace, and a badge, all engraved on "bull's mouth" shells. The necklace consists of 10 shell cameos in gold filigree, done by Italian Renaissance craftsmen. The Badge of the Order of St. Michael, which shows a picture of St. Michael overcoming Satan, is a very rare 17th century piece of workmanship. There is also a 19th century cameo shell, displaying a profile bust of George Washington, signed Michelini, a noted French 19th century craftsman.

Technique.—In the May 1913 issue of the *American Museum Journal,* L. P. Gratacap, assistant curator of the American Museum of Natural History, gives a standard description of the technique of shell cameo carving. The process consists of six principal steps: (1) The selection of shells which are desirably clear, firm, and colorful. (2) With a revolving tin wheel, the artist cuts from a selected shell a piece suited in shape and size to the measurements of his design. (3) After the removal of all imperfections in the shell, its outer edge is cut into an oval, square, or oblong form. (4) The next step is to clean the shell surface and, with the aid of a graving tool, or burin, to engrave a specific sketch. (5) The artist, using pumice burnishers and oil, now proceeds to deepen and variegate the color effects. (6) The acid is then quickly removed, to prevent chemical corrosion from spoiling the smoothness, radiance, or harmony of the design. The Italian shell engravers were microscopic experts. The 16th century shell cameo, *Ganymede,* now in the British Museum, reveals an artistry in minute detail that equals the best detail work on cameos cut in precious stones.

FELIX GRENDON.

SHELL MONEY. See WAMPUM.

SHELL POINT, unincorporated community, California, in Contra Costa County. This tract of land (631 acres), located on the Suisum Bay, is owned by the Shell Chemical Corporation. Prior to 1930 the tract was known as Stake Point but with the purchase by Shell Chemical, the community was referred to as Shell Point. On the acreage is manufactured anhydrous ammonia and ammonium sulphate. Pop. (1950) 4,674.

SHELLABARGER, Samuel, American educator, biographer, and historical novelist: b. Washington, D.C., May 18, 1888; d. Princeton, N. J., March 21, 1954. From relatively obscure achievements as an author, he moved in the last decade of his life into best-selling popularity.

He was educated at Hill School, Pottstown, Pa., and at Princeton University, from which he was graduated in 1900. After studying for a year in Munich, he returned to Princeton to spend two years as an instructor in English. After World War I, he resumed teaching at Princeton, this time as assistant professor of English, with a Ph.D. gained at Harvard University in 1917. He served in World War I as first lieutenant of Military Intelligence, attached to the United States legation in Stockholm. Shellabarger returned for four more years at Princeton, leaving in 1923 to begin several years of preparation for authorship in the historical field, with Lausanne, Switzerland, as his headquarters.

While he traveled widely through Europe, he specialized in research concerned with the Renaissance and with 18th century European history. First results were the scholarly biographies, *The Chevalier Bayard: A Study in Fading Chivalry,* published in 1928, and *Lord Chesterfield,* which followed seven years later (republished in 1951 as *Lord Chesterfield and His World*). Both works received only mild critical acclaim, as did a first novel, *The Black Gale,* published in 1929. Under the pseudonym John Esteven, Shellabarger published mysteries at the rate of one a year for several years, beginning with *The Door of Death* (1928). A romance, *Grief Before Night* (1938) was published under the pseudonym Peter Loring. He returned in the latter year to the academic world, becoming headmaster of the Columbus (Ohio) School for Girls until 1946, but continuing his literary researches and the habit of a steady daily production quota, in longhand, on works of "reconstructive imagination."

Captain from Castile, product of three years' study of Spanish source material dealing with the conquest of Mexico, was sold in 1944, for motion picture production, before publication. It was translated into 18 languages, including Pakistani and Turkish. *Prince of Foxes,* a sweeping Renaissance tapestry, published in 1947, also became a motion picture. *The King's Cavalier* (1950) and *Lord Vanity* (1953), the latter also sold to the motion pictures, were likewise immensely popular.

Besides those already mentioned, Shellabarger's works included the mysteries, *Voodoo* (1930), *By Night at Dinsmore* (1935), *While Murder Waits* (1936), *Graveyard Watch* (1938), *Blind Man's Night* (1938), and *Assurance Double Sure* (1939); and the romance, *Miss Rolling Stone* (1939), published under the name of Peter Loring.

SHELLAC. See LAC; LACQUER AND LACQUERWORK.

SHELLEY, shĕl'ĭ, **Harry Rowe,** American organist and composer: b. New Haven, Conn., June 8, 1858; d. Sept. 12, 1947. He studied music with Carl Stoeckel, and afterwards under Dudley Buck, and Anton Dvořák. He completed his studies in Paris and London, and for 10 years from 1899 was organist at the Fifth Avenue Baptist Church, New York City. Thereafter for 20 years he was at Central Congregational Church, Brooklyn, N. Y. Among his compositions are the cantatas *Death and Life, Vexilla Regis,* and *The Inheritance Divine; Santa Claus Overture;* the orchestral suite *Souvenir de Baden-Baden,* and two symphonies, a violin concerto, songs, and organ pieces.

SHELLEY, Mary Wollstonecraft Godwin, English writer: b. London, Aug. 30, 1797; d. there, Feb. 21, 1857. She was the daughter of William Godwin and Mary Wollstonecraft. In 1814 she eloped with the poet Shelley to Switzerland, and after the death of his wife, Harriet Westbrooke, was married to him. While traveling with him she composed her famous romance of *Frankenstein* (1818), which excited an immense sensation. After her husband's death she devoted herself much to literary work, producing *Valperga* (1823); *The Last Man* (1826); *Lodore* (1835); *Falkner* (1837); and other works of fiction; biographies for the *Cabinet Cyclopaedia; Journal of a Six Weeks' Tour,* with Shelley (1814); *Rambles in Germany and Italy* (1844); and

an edition of Shelley's poetical works and miscellaneous writings. (See FRANKENSTEIN). Consult Marshall, Mrs. Julian, 'Life of Mary Wollstonecraft Shelley' (London 1889).

SHELLEY, Percy Bysshe, English poet: b. Field Place, near Horsham, Sussex, 4 Aug. 1792; d. by drowning in the Bay of Spezzia, on or after 8 July 1822. He was the eldest son of Timothy, afterward Sir Timothy, Shelley, a not over-intelligent country gentleman, and grandson of Sir Bysshe Shelley, who was something of an adventurer, handsome, clever and graceless. His mother, Elizabeth Pilford, seems to have handed on to him her beauty and her fondness for writing. After some tutoring he was sent to Sion House Academy, at Brentford, a middle class school, where his shyness and delicacy exposed him to brutal bullying. His biographers seem right in dating from this period his hatred of tyranny and resistance to all forms of oppression. He seems also to have developed his faculty for musing, for scientific speculation and for wide reading, especially at this time in the wild romances of Mrs. Radcliffe and others of her class. On 29 July 1804 he entered Eton where he remained for five years, developing along the lines just described. His tutors were not calculated to inspire his respect and thus could do little or nothing to check his extravagant and abnormal tendencies; nor could the outrageous fagging to which he was subjected fail to be deleterious to so sensitive an organization as his. He was nicknamed «Mad Shelley,» lived as much apart as he could, dabbled in chemistry, haunted romantic spots, read widely — acquiring a taste for the classics, — and found some consolation in the society of Dr. James Lind (later represented as the hermit in 'The Revolt of Islam' and as Zonaras in 'Prince Athanase'), an elderly physician of scientific and eccentric tastes, who was apparently more sympathetic than discreet in his relations with a youth in need of guidance. As was natural, the precocious boy soon began writing and before he was 17 had composed a Radcliffian romance, 'Zastrozzi,' as well as some immature poetry — e.g., parts of the 'Wandering Jew' written in conjunction with his cousin and future biographer, Thomas Medwin, who had also been with him at Sion House. Perhaps more important for his future was his interest in serious writers both practical and theoretical, Franklin, Pliny, Condorcet, who strengthened his native bent toward inquiry and were in part responsible for his early abandonment of religious orthodoxy.

Shelley left Eton, with somewhat unexplained abruptness, in the summer of 1809; he matriculated at University College, Oxford, 10 April 1810. From the amount he published in the latter year it would seem that he spent much of the interim in writing, and it is known that he had a love affair with a cousin, Harriet Grove. At Oxford he formed a friendship with the able, rather cynical Thomas Jefferson Hogg, and was encouraged in his wholesale recalcitrancy. The university was little hospitable to advanced ideas, and when Shelley sent to bishops and heads of colleges, copies of his syllabus of arguments demonstrating 'The Necessity of Atheism,» it was small wonder, though a great pity, that, on his failure to answer their questions, the authorities should have handed him a sentence of expulsion already signed and sealed. (25 March 1811). Hogg protested and was also expelled.

The offending pamphlet was Shelley's sixth publication, and he still lacked several months of being 20. In 1810 he had published — how, is something of a mystery — 'Zastrozzi'; 'Oriental Poetry by Victor and Cazire' (written in conjunction with his sister Elizabeth, withdrawn on the ground that she had borrowed from «Monk» Lewis, long sought for in vain, but finally edited by Dr. Richard Garnett in 1898); 'Posthumous Fragments of Margaret Nicholson' (the mad woman who had tried to kill George III); and 'Saint Irvyne; or, the Rosicrucian,' another Radcliffian romance. It is needless to say that these productions are devoid of intrinsic merit. His fifth publication was 'A Political View of the Existing State of Things,' issued anonymously at Oxford for the benefit of Peter Finerty, a prisoner for libel. This has entirely disappeared.

Shelley left Oxford with mingled regret and indignation and took lodgings in London. His affair with his cousin Harriet Grove had been broken off, and he was soon involved in the most unhappy entanglement of his much entangled life. Not being permitted to come home unless he would break with Hogg and refusing to do this, he found himself adrift in London, and fate brought him in contact with a friend of his sister Elizabeth's, Harriet Westbrook, the pretty daughter of a retired hotel-keeper. She was romantic and fancied herself persecuted by her family; Shelley was also romantic, and persecuted, and quixotic, and inflammable. When he went out of town in July 1811 she wrote him pitiful letters, which so worked upon his feelings that he returned to London, ran away with her and married her at Edinburgh at the end of August. How far the girl's relatives connived at the capture of the baronet's son cannot be ascertained. Naturally the Shelleys were indignant, and cut off the madcap's allowance; but Mr. Westbrook allowed them £200 a year, and finally Shelley's father contributed the same amount.

It is unnecessary to detail their movements at this juncture save to say that they spent some months at Keswick near Southey and then, Shelley being inspired by the theories of William Godwin (q.v.), they went over to Ireland to attempt to redress the wrongs of the long-suffering people. They were accompanied by Harriet's sister, Eliza Westbrook, whose presence grew distasteful to Shelley, and they remained only about two months, since the Irish did not respond enthusiastically to Shelley's pamphlets. He was merely a visionary a little ahead of his times, for Catholic emancipation came peacefully not so many years after his death. When he returned to England, he excited the attention of the government by revolutionary writings, but he was not molested. Believing, however, that an attempt had been made to assassinate him, he returned with his wife and sister-in-law to Ireland, and then he went with Harriet to London, where their first child was born (June 1813). About this time he printed privately his nebulous poem of freethought 'Queen Mab,' accompanied by notes and a «vindication» of vegetarianism to which he had become a convert. Eight years later a pirated edition brought 'Queen Mab' into notoriety, much to its author's disgust. A dia-

logue pamphlet, 'A Refutation of Deism' (1814), followed, bringing his publications up to the number of 14. Meanwhile he and Harriet had become estranged, partly no doubt from natural incompatibility, partly from Shelley's instability, to use no stronger term. Critics and readers will probably never agree to the exact distribution of responsibility between the unfortunate pair; but it seems manifest that admiration for Shelley's genius has unduly influenced many of his biographers in their treatment of the matter. He met Mary, the daughter of William and Mary Wollstonecraft Godwin, and, as before with Harriet, found an attractive girl pining for sympathy at a time when he himself stood in need of it. She was a much more congenial partner for him than the inkeeper's daughter, to whom he had just been remarried according to the rites of the Church of England, and after Harriet made the mistake of leaving him and going with her child to her father's at Bath, he lost little time in persuading his new 17-year-old friend to elope with him.

They left England on 28 July 1814 taking with them Jane (Claire) Clairmont, a daughter of Godwin's second wife by a former marriage. They spent some time in Switzerland and then, after some financial difficulties, returned to England in September. Their experiences were later recounted by Mary Shelley in 'The History of a Six Weeks' Tour' (1817). Meanwhile Shelley had made Harriet the astounding proposition that she should live with him and Mary, and after his return to England he saw her and the son she had borne him during their separation. No reconciliation was affected, however, and Shelley naturally found himself cut off from all his former sources of income. The death of his grandfather early in 1815 induced his father to allow him £1,000 a year in order to guard against his encumbering the family estate. He settled £200 a year on Harriet, took a house near Windsor Forest wrote 'Alastor' (1816, a poem still immature in thought, but indicating a great advance in his command of poetic technic), and studied the classics. In May 1816 he went again to Switzerland with Mary and Jane Clairmont, and there he came under Byron's (q.v.) sway, exerting in his turn a strong influence upon his new friend. The autumn found Shelley back in England established at Great Marlow. Here, in December 1816, he learned of Harriet's suicide in the Serpentine. The immediate causes of the act are obscure; but, whether or not the charges that have been made against Harriet's morals during the closing months of her life are fully or partially justified, it seems absurd to acquit Shelley of all responsibility for her tragic fate.

He was now free to marry Mary Godwin (30 Dec. 1816) but the law would not allow him to recover the control of his two children by Harriet. Shelley resented Lord Eldon's decision, with some justice so far as the management of their education was concerned; yet he had certainly so conducted himself as to make the Chancellor's decision seem equitable to most people at the time. Meanwhile a son, William, had been born to him and Mary, Leigh Hunt had become a friend, and Keats an acquaintance, and the elaborate narrative and allegorical poem 'Laon and Cythna' had been begun. Two political tracts were also published and, true to the humanitarian principles that always actuated his conduct, even when its effects were deleterious to others, Shelley ministered to the sick and needy around him. His charity seemed boundless, and during his visitations he contracted a bad case of ophthalmia. His health had been otherwise poor and, as for many reasons England was not a congenial dwelling-place, he determined to go to Italy. He left England with his family, and by the end of March 1818 was at Turin. Two months previously Ollier had reissued under the title of 'The Revolt of Islam,' the long poem, which on its first appearance, had been entitled 'Laon and Cythna.' The relationship between the hero and heroine had been too close to suit any save the most emancipated readers, and Shelley had reluctantly made a few alterations, in the interest not so much of conventionality and the success of the poem as a plea for the cause of oppressed peoples. No changes could make so long and misty a performance popular; but lovers of poetry will always find 'The Revolt of Islam' incomparable for its glowing pictures and its exquisite melodies. Both in its merits and in its defects it reflects as though it were a mirror, its author's unique, attractive, yet singularly incomplete and unbalanced genius.

The first months in Italy were spent at Lake Como, Milan and the Baths of Lucca, and saw the completion of the romantic poem 'Rosalind and Helen' and the translation of Plato's 'Symposium.' Then Shelley with Jane Clairmont took a disagreeable journey to Venice to see Byron with regard to Miss Clairmont's illegitimate daughter Allegra. (See Byron). The poem 'Julian and Maddalo' commemorates some features of the visit. Byron loaned Shelley a villa at Este, and the latter at once sent for his family. A few weeks later Mary's second child, Clara, died at Venice. Returning to Este, Shelley began 'Prometheus Unbound' and, charmed by the scenery, wrote the first draft of his beautiful 'Lines Written Among the Euganean Hills.' The winter of 1818–19 was spent at Naples, which inspired, among other things, the 'Lines Written in Dejection,' and a magnificent ode to the beautiful and oppressed city. He also wrote to his friend, Thomas Love Peacock, letters justly famous for their powers of description and admirable prose style. The spring of 1819 found him settled in Rome hard at work upon what is often regarded as his greatest achievement, the aspiring but somewhat nebulous lyrical drama, 'Prometheus Unbound,' published in 1820. Immediately after this he wrote the much more realistic tragedy entitled 'The Cenci,' probably the least subjective of his works, which was composed and published at Leghorn in 1819 Shortly before he left Rome in the summer his son William sickened and died. The well-nigh heart-broken parents retired to Leghorn and then to Florence, where another son, afterward Sir Percy Florence Shelley, was born. Here in October Shelley wrote that splendid poem, probably the most nobly imaginative of all his lyrics, the 'Ode to the West Wind,' as well as two of his less successful, posthumously published poems, the parody 'Peter Bell the Third' and 'The Masque of Anarchy,' inspired respectively by Wordsworth's famous

poem and by the infamous Manchester Massacre.

The beginning of 1820 saw the wanderers established at Pisa, where Shelley's health began to improve. Several English friends, the Gisbornes and the Williams, and later Lord Byron and the traveler, Trelawny, added to the attractions of the place and stimulated Shelley's genius, if not to the production of any elaborate poems of consequence save 'Adonais' and 'Hellas,' at least to the writing of some of his most beautiful lyrics and charmingly familiar pieces. Among the poems of 1820 were the 'Epistle to Maria Gisborne,' the fantastic 'Witch of Atlas,' the exquisite 'Sensitive Plant,' and those matchless lyrics of their kind, 'The Cloud' and the 'Ode to a Skylark.' The chief productions of 1821 were the Platonic 'Epipsychidion,' the final form of which was inspired by an idealistic passion Shelley conceived for Emilia Viviani, an Italian girl confined in a convent against her will, the delightful and eloquent 'Defence of Poetry' (in prose), the immortal elegy on Keats, 'Adonais' (Pisa 1821), and 'Hellas,' a lyrical drama reflecting the emotions kindled in its liberty-loving author by the Greek revolution. The last-named piece, in some of its choruses at least, gives evidence of such maturing powers that, when we take into account the range of Shelley's interests, mental and emotional, we find it difficult to set limits to his possible achievements if he had been permitted to live and had developed as steadily and as rapidly as he did during the closing years of his short life. It is true that 'Epipsychidion,' despite its marvelous beauty of description and its intensity of spiritual passion, shows that Shelley's idealism was still capable of giving an unwholesome turn to his writings and, to put it mildly, a fatuous twist to his conduct. It is true also that the part Shelley took in luring Leigh Hunt to Italy to start 'The Liberal' (see HUNT, J. H. L., and BYRON) scarcely argues a great increase in worldly wisdom, though it speaks volumes for Shelley's generosity. But, when all deductions are made, the development and the promise of Shelley's 28th, 29th and 30th years are scarcely less remarkable than the development and promise of Keats in the marvelous year of his great odes and 'Lamia.'

In 1822 Shelly began a drama on Charles I, but did his best work on translations from 'Faust' and Calderon's 'Mágico Prodigioso' and on the highly imaginative 'Triumph of Life,' unfortunately left incomplete. In April the Shelleys went with the Williamses to Lerici, and there the friends passed an ideal time until the arrival of the Hunts drew the kind-hearted Shelley early in July to Leghorn and Pisa to look after their comfort. On 8 July he began his return journey with Williams in the yacht *Ariel*, which they owned jointly. Trelawny watched them sail away, saw a squall come up and, when it was over, could catch sight of them no more. His suspicions that all was not well were allayed for a time; but, as the days passed, every one interested in the two voyagers lost hope. On 18 July Shelley's body — if the copies of Sophocles and Keats found in the pockets definitely marked it as his — was washed ashore near Via Reggio. It was first buried in the sand, then cremated — save the heart which would not burn — and the ashes were buried in the Protestant cemetery at Rome (7 Dec. 1822) under the pyramid of Caius Cestius and near the grave of Keats. There seems to be little reason to credit the notion that the yacht was designedly run down.

Shelley is said to have been tall and slender, very youthful in appearance, with a fair complexion and dark blue eyes full of artless wonder. Trelawny at first sight almost took him for a girl. His receptivity, gentleness, charity and other exquisite traits suggest the woman as did his appearance; but his fiery hatred of oppression and shams, his calm defiance of public obloquy, his power to charm men of the world forbid us to regard him as in any sense effeminate. In his writings no less than in his character and in his appearance this blending of essentially manly and essentially womanly characteristics is perceptible. His ideals were passive rather than active; his most indisputably successful poems are in theme and tone expressions of longing, weakness, pain and sadness; his best descriptive passages are hazy; his verse is fluid and melodious rather than deeply harmonious. On the other hand, he has had the power to inspire strong souls with his ideals; more than any other of our poets he has caught the Greek secret of endowing with life mythical figures and conceptions; he was a scholar, a critic, a man of taste and a prose-writer of no mean order; his genius was varied and copious beyond that of most of his contemporaries. With regard to his final rank in English literature no consensus of opinion seems attainable. While the public indifference that depressed him in his own day has long been overcome, he has never attained true popularity either at home or abroad, and his critics are only too likely to become his worshippers or else to display too openly a feeling of hostility toward his life and works. He is still too much the idol of advanced spirits and of people who are inclined to be a trifle exquisite in their literary tastes and somewhat supercilious with regard to the tastes of others. His position as a great poet is scarcely open to question, but his position as a genuine classic in the fullest sense of the term is surely doubtful so long as Matthew Arnold and other qualified critics dissent from the praise of his ideals, the defense of his conduct, and the enthusiasm for his elaborate poems such as 'Prometheus Unbound' to be encountered in extravagant measure in the books and essays of his admirers. Perhaps it is safe to conclude that, while his conduct must be censured in many particulars, his character must be pronounced singularly winning and lovable, and, that, while his elaborate poems, though wonderful, are not sustained works of art, his genius as a lyrical poet is in range and quality unique and extraordinarily high. See ADONAIS; CENCI, THE; ODE TO THE WEST WIND; PROMETHEUS UNBOUND; QUEEN MAB; TO A SKYLARK.

Bibliography.— Various volumes of Shelley's poems, imperfect and in some cases pirated, helped to spread his small reputation until 1839, when Mrs. Shelley published an edition of his works in four volumes. Many important poems and letters have since been published — e. g., in Richard Garnett's 'Relics of Shelley' (1862). The most complete edition of the works in verse and prose is that by H. B. Forman (8 vols., 1876–80). There are good editions of the

poetry by H. Buxton Forman (London 1892), E. Dowden (London 1893), G. E. Woodberry (Boston 1901), and T. Hutchinson (Oxford 1904). The prose works have been edited by R. H. Shepherd, 2 vols. (London 1888), and selections of Shelley's letters have appeared, including those edited by S. C. Hughson (Chicago 1892), R. B. Johnson (London 1929), and volumes 8 to 10 of the complete works edited by Roger Ingpen and Walter E. Peck, 10 vols. (London 1926–1930). Consult earlier lives by Leigh Hunt, T. J. Hogg, 4 vols. (London 1858), E. J. Trelawny (Boston 1858), and T. Medwin, new ed. (London 1913); and the biographies by J. A. Symonds (New York 1894), E. W. Edmunds (New York 1922), E. Dowden, new ed. abridged from the original 2 vols. (London 1932), and Humbert Wolfe, 2 vols. (London 1933), recapitulating the lives by Hogg, Trelawny, and T. L. Peacock; special studies by O. W. Campbell (*Shelley and the Unromantics,* New York 1924), André Maurois (*Ariel,* New York 1924), and E. Carpenter and G. Bornefeld (*Psychology of the Poet Shelley,* New York 1925); and critical essays, especially those by Matthew Arnold, Walter Bagehot, Edward Dowden, Richard Garnett, Leslie Stephen, and George E. Woodberry.

WILLIAM P. TRENT,
Late Professor Emeritus of English Literature, Columbia University.

SHELLEY'S CASE, Rule in, a rule declared by the courts of England late in the 16th century. By this rule when an estate of freehold is acquired by gift or purchase by an ancestor, with remainder to his heirs or the heirs of his body, the word "heirs" is a word of limitation and not of purchase; that is, the ancestor takes the estate in fee or in tail, according to circumstances, and the heirs take nothing. The rule has been repealed or amended by statute in most jurisdictions in the United States, and it was abolished in England and Wales by legislation effective Jan. 1, 1926.

SHELTER ISLAND, N. Y., island and township, Suffolk County; situated at the eastern end of Long Island between Peconic and Gardiners bays; length, eight miles; width, four. It is connected with the mainland and the Long Island Railroad by ferry to Greenport. The island was originally owned by the Manhasset Indians; was acquired by Lord Sterling, and during colonial times belonged to the jurisdiction of Connecticut. The coast line is irregular and deeply indented with small bays and inlets, affording good harbors for yachts and small craft; there are excellent facilities for pleasure boating and fishing, and the island is a popular summer resort. There is a monument to the Quakers who sought refuge here in 1652. Pop. (1950) 928.

SHELTON, Don Odell, American evangelist and editor: b. Odessa, N. Y., May 5, 1867; d. Briarcliff Manor, N. Y., Jan. 29, 1941. He was secretary of the East Side Branch of the Young Men's Christian Association in New York in 1889–1899, and in 1906 became president of the National Bible Institute, New York. He founded the *Bible Today,* and in 1909 became editor of the *Message.* Author of *Personal Work and the Personal Worker* (1896); *Public Use of the Bible* (1898); *Christianize America* (1903); *The Prayer that Changes Things* (1915).

SHELTON, Thomas (fl. 1612–1620), translator into English of Cervantes' *Don Quixote* (*Don Quijote de la Mancha*), part one appearing in his translation in 1612, and part two in 1620. Both parts were translated from editions published in Brussels. Shelton's translation has been highly prized among English versions of the book because of the liveliness and vigor of his language.

SHELTON, Conn., town in Fairfield County; alt. 120 feet; on the Housatonic River; 14 miles north of Bridgeport; on the New Haven Railroad. Industries are drop forge products, crucibles, sponge rubber products. Pop. (1950) 12,269.

SHEM, the eldest son of Noah; according to the Mosaic account, he is the father of all the nations that inhabited southwestern Asia (Gen. 10:21-31), a territory inclusive of Syria, Chaldaea, parts of Assyria, of Persia, and of the Arabian peninsula. Hence the inhabitants are called Semites, and their language and civilization styled Semitic.

SHEMAIAH, shĕm-â-ī'ŭ, (Heb. God has heard), a name of various Old Testament prophets and priests, including the Shemaiah who with Abtalion taught Hillel, "The Babylonian," head of the Sanhedrin during part of the reign of Herod.

SHEMAKHA, shĕ-mä-kä', town in Azerbaijan Socialist Soviet Republic on the Zagolovai, about 63 miles northwest of Baku. It is situated in the midst of mountains, on verdant slopes and was once a commercial center. It has, however, suffered from earthquakes, and one in 1902 almost destroyed it. Silk manufacture is the chief industry. Shemakha's history from 1712 was one of almost continuous warfare; it was captured and occupied in turn by various Persian, Turkish and Russian commanders. On Ptolemy's map it is set down as Kamachia. Pop. (1939) 3,651.

SHENANDOAH, shĕn-ăn-dō'à, Iowa, city in Page County; on Nishnabotna River; 58 miles southeast of Council Bluffs, on the Chicago, Burlington and Quincy; and the Wabash railroads. There are seed firms, railroad repair shops, packing houses, and manufactures of stock powder, husking pegs, creamery products, beverages, confectionery, and thumb stalls. The largest nurseries in the West are located at Shenandoah. Pop. (1950) 6,938.

SHENANDOAH, Pa., borough in Schuylkill County; alt. 1,300 feet; on the Reading System; Lehigh Valley; and Pennsylvania railroads; 12 miles north of Pottsville. The borough lies in a valley, in the richly yielding anthracite coal country. Mine chambers beneath the city sometimes cave in, opening cracks in a city street, or causing the displacement or collapse of a wall or building. There are meat packing plants and textile mills in the city; the mining of hard coal, however, is the principal industry. There is some trade in produce from the farms in the surrounding area; this consists principally of dairy products and truck crops.

Settlement was made on the site as early as 1835, but it was not until the coal deposits were first exploited in 1862 that the borough's real development began. In that year the townsite was platted, and in 1866 the borough was incorporated. In 1883, Shenandoah was almost completely destroyed by fire. Government is administered, as is common in Pennsylvania boroughs, by burgess and council; they are elected by popular vote. The borough's water supply is municipally owned; its power and light system is privately controlled. Pop. (1950) 15,704.

SHENANDOAH, shĕn-ăn-dō'ȧ, a river in Virginia which has its source in Augusta County, and flows northeast, on the west side of and nearly parallel to the Blue Ridge. It enters the Potomac at Harper's Ferry, W. Va. Its total length is about 170 miles. It flows rapidly over nearly all its course and furnishes extensive water power which is used for manufacturing and has contributed greatly toward the industrial prosperity of the valley. The valley of the Shenandoah was the scene of many stirring engagements of the Civil War.

SHENANDOAH, The, a ship named after the Shenandoah River, Virginia, bought by the Confederate States during the American Civil War (1861–1865), and placed in commission as a privateer during the last year of that war. The *Shenandoah* was built in Glasgow in 1863; she was intended for the Far Eastern trade but was purchased by the Confederates in 1864 and in October of that year was commissioned as a privateer. The ship, named the *Sea King,* had sailed from London for Madeira, where she received her privateersman's crew, composed mostly of officers from the *Sumter,* the *Alabama,* then destroyed, and the *Georgia,* and common sailors, under the command of Capt. James I. Waddell. The *Shenandoah* sailed from Madeira and circumnavigated the globe, via Melbourne, being the only Confederate vessel to do so. In the course of her career she captured or destroyed 39 of the enemy's vessels, valued in the aggregate at about $2,000,000. Her last action, the last hostility of the war, was on June 28, 1865, about three months after the war had ended, when the *Shenandoah* appeared among the American whalers near the Bering Straits and captured 10 vessels before nightfall. On August 2, Captain Waddell learned from an English bark of Lee's surrender, five months before. He sailed at once to Liverpool and delivered his ship to the British man-ŏf-war *Donegal,* never having been captured nor defeated in his entire career. The British government released all of the crew not British-born and turned the vessel over to the American consul.

SHENANDOAH MOUNTAINS, a range in Virginia, belonging to the Alleghenies, extending from Bath County, Va., about 80 miles northwest, partly along the state line, into Hardy County, W. Va. The range forms the western boundary of the Shenandoah Valley. The highest point is over 4,400 feet, just west of Harrisonburg, Va.

SHENANDOAH VALLEY, Virginia, between the Shenandoah Mountains on the west and the Blue Ridge Mountains on the east. It is noted for its surpassing beauty, for the magnificent caverns in it, and as an agricultural region, being one of the most fertile sections of the state. Around Winchester, it is famous for its apple orchards, and here each spring is held the "Apple Blossom Festival," which attracts thousands. Other towns in the valley include Staunton and Harrisonburg. For an account of the battles fought in the valley during the Civil War see article following.

SHENANDOAH VALLEY, Military Operations in. At the beginning of the Civil War the Shenandoah Valley was the garden spot of Virginia, full of grain and hay and teeming with livestock and other supplies essential to the Confederates. It became the beaten track and alternately the camping ground of both armies, witnessed much brilliant strategy and many hard fought battles, and at the close of the war was a scene of desolation. Its topography favored the Confederates, since, as covered on the east by the Blue Ridge, it was the easiest route for threatening Washington and the most direct route for their armies to move into Maryland and Pennsylvania.

1861.—Virginia passed an ordinance of secession on April 17, and the next night state troops moving, without authority of the governor, from Staunton and other points in the valley, seized Harper's Ferry, with its arsenal, armory and munitions of war, the small United States guard abandoning the place and retreating to Carlisle, Pa. The town was speedily occupied by several Virginia regiments, and Col. T. J. Jackson put in command. Jackson was relieved by Gen. J. E. Johnston on May 23. Upon the dash of Col. Lew Wallace on Romney, June 13, and the approach of Gen. R. Patterson from Chambersburg to Williamsport, threatening his position, Johnston, on June 15, burned all the bridges of the Potomac from Harper's Ferry northward to Williamsport, abandoned Harper's Ferry and fell back to Winchester. On July 2, Patterson crossed the Potomac at Williamsport, occupied Martinsburg and, under General Scott's order, threatened Johnston at Winchester, to hold him there, while General McDowell advanced on General Beauregard at Bull Run; but on July 18 Johnston eluded Patterson and with 9,000 men marched through Ashby's Gap to Piedmont and took cars for Manassas.

The Union occupation of the lower valley was brief; Patterson, after Johnston had left the front, fell back to Harper's Ferry, where, on July 25, he was relieved by General Banks, when the Union troops, save a small guard at Harper's Ferry, were withdrawn to the Maryland side of the Potomac. Late in October Stonewall Jackson was assigned to the command of the Confederate forces in the lower valley, with headquarters at Winchester, and was reinforced by Loring's division from West Virginia. Jackson swept the few Union outposts from the fringes of the valley, broke the Baltimore and Ohio Railroad and Chesapeake and Ohio Canal in several places, as far westward as Hancock, and on Jan. 10, 1862 drove the Union forces from Romney and occupied it with Loring's division. By order of the Confederate secretary of war, January 31, Loring was withdrawn from Romney to Winchester, where Jackson remained during the rest of the winter, the Union forces again occupying Romney on Feb. 7, 1862, demonstrating on Winchester and sending expeditions southward to bring in cattle.

1862.—Active operations began in the valley late in February by the movement of two Union

divisions across the Potomac at Harper's Ferry and an advance on Winchester, near which Lander's division from Romney and the south branch of the Potomac joined the column. Manassas and Centreville were evacuated by Johnston on 8 and 9 March, and Jackson, with his 5,000 men, under Johnston's order, abandoned Winchester on the night of the 11th, as he was on the eve of giving battle to General Banks, and fell back up the valley 42 miles to Mount Jackson, followed by Shields' (formerly Lander's) division of Banks' corps. On the 20th Shields moved back to Winchester, followed by Jackson. Informed on the march that part of Banks' corps was being sent from the valley to reinforce McClellan east of the Blue Ridge, Jackson, in order to detain it in the valley, pressed Shields closely, skirmished with him on the evening of the 22d, and next day brought him to battle at Kernstown (q.v.), less than four miles south of Winchester, and being defeated, again retreated up the valley. His action had the desired effect; Williams' division, which was on the march through Snicker's Gap of the Blue Ridge, was recalled and Banks again pursued Jackson up the valley as far as Harrisonburg, 66 miles from Winchester. Jackson fell back to Swift Run Gap, in the Blue Ridge, on the road from Harrisonburg to Gordonsville, where he watched an opportunity to strike Banks in flank and rear should he advance from Harrisonburg to Staunton. Under President Lincoln's order Banks fell back to Strasburg, and Frémont, commanding a corps, was ordered to move from Franklin and Monterey to co-operate with Banks in an advance on Staunton. Jackson, informed of Frémont's advance, made a rapid movement from Swift Run Gap to Staunton and, pushing through that place on 5 May, engaged Frémont's advance, under Generals Schenck and Milroy, on the 8th, and in a hard-fought battle checked it, Schenck falling back to Franklin. (See McDowell, Irvin). Jackson followed to Franklin, found Schenck too strongly posted to attack and on the 12th began his return march to the valley to attack Banks. On the 19th he started from Mount Solon, near Harrisonburg, on the 21st crossed the Massanutton Mountains from New Market to Luray, and, joined by Ewell's division, swept down the Luray Valley, with over 16,000 men and 48 guns, defeated Colonel Kenly's command of 900 men at Front Royal (q.v.), 23 May, and pursuing, captured the most of it. This movement turned Banks' fortified position at Strasburg, and on the morning of the 24th Banks retreated northward on the valley pike, was struck in flank by Jackson at Middletown and Newtown, but foiled his efforts to intercept him, and after a running fight from Middletown to Winchester, halted on the night of the 24th at Winchester to give battle. On the morning of the 25th Jackson attacked Banks, who had about 7,000 men, defeated him and drove him across the Potomac at Williamsport. (See Winchester, Battle of). Jackson halted his main body a few miles beyond Winchester, but the cavalry followed Banks to the river. On the 28th Jackson sent part of his force toward Harper's Ferry, which made a demonstration, as though intending to force the position and cross into Maryland. Meanwhile Frémont and McDowell, moving respectively from Franklin on the west and Fredericksburg on the east, were converging on Strasburg, in Jackson's rear, to cut him off, upon which he abandoned his demonstration on Harper's Ferry and, starting from Winchester early in the morning of the 31st, by a rapid march slipped through the net prepared for him and arrived at Strasburg 1 June, Frémont's skirmishers being within a mile of the road over which he passed. Next day Frémont gave a stern chase on the valley pike, and Shields' division, now of McDowell's corps, marching by Luray Valley, endeavored to reach Jackson's rear or strike him in flank. Frémont pressed his rear closely in many sharp encounters, driving him steadily through Woodstock, Edenburg and Mount Jackson; but Jackson, avoiding a general engagement, when arriving at Harrisonburg, sent his sick and wounded to Staunton, and 6 June, turning to the left, marched toward Port Republic. Later in the day his rear guard had an encounter with Frémont's advance near Harrisonburg (q.v.), in which Gen. Turner Ashby, a gallant Confederate cavalry commander, was killed, and the result of which was that Frémont's advance was repulsed. Frémont advanced in force from Harrisonburg on the morning of the 8th, and at Cross Keys (q.v.) was met by Jackson, who, after a severe fight, repulsed him. Leaving Ewell's division to resist Frémont, should he renew the fight next morning, Jackson marched the rest of his army to Port Republic to meet Shields, who was moving up Luray Valley, and whose advance, under Colonel Carroll, had dashed into Port Republic on the morning of the 8th, was driven out and joined later in the day by a brigade under Col. E. B. Tyler. Jackson attacked the two brigades of Tyler on the morning of the 9th, and at first was repulsed, but finally, on being reinforced, after a hard fight, drove Tyler from the field and back into Conrad's Store, on the other two brigades of Shields' division. (See Port Republic, Battle of). Ewell had been recalled from Frémont's front, the bridge over the South Branch destroyed, thus checking Frémont's pursuit, and that night Jackson marched to Brown's Gap in the Blue Ridge. Frémont and Shields were ordered to cease pursuit and fall back, the former to Middletown to join Sigel and Banks, who had advanced from Harper's Ferry and Williamsport, the latter to join his corps at Fredericksburg. The Valley campaign of 1862 established Jackson's fame as a soldier. From the date of his arrival at Staunton, 5 May, to the battle of Port Republic was 35 days, during which he had marched about 300 miles, fighting four battles and engaging in many other encounters, and with 16,000 men had kept 60,000 Union troops employed, and paralyzed McClellan's campaign against Richmond. On 17 June Jackson stole quietly away from Brown's Gap to join Lee on the Chickahominy. Munford's cavalry brigade and a few infantry were left in the valley to demonstrate in the direction of Strasburg, and Munford was soon relieved by Robertson's brigade, which took post at Harrisonburg and New Market. When General Pope, 27 June, took command of the Army of Virginia, formed by the corps of Frémont, Banks and McDowell, he withdrew Frémont and Banks from the valley to the east of the Blue Ridge, leaving garrisons of a small brigade each at Winchester, Martinsburg and Harper's Ferry

to cover the Baltimore and Ohio Railroad. Throughout July and August 1862 the valley enjoyed comparative quiet. In August Lee advanced upon Pope and drove him back to the defenses of Washington, then crossed the Potomac into Maryland by a route east of the Blue Ridge. Upon arriving at Frederick and finding, contrary to his expectations, that Martinsburg, Winchester and Harper's Ferry were still held by Union troops, interposing on his proposed line of supply through the Shenandoah Valley and interfering with his intended movement into Pennsylvania, Lee on 10 September sent Jackson across the Potomac at Williamsport to clear the valley of Union troops and capture those at Harper's Ferry. Winchester had already been abandoned; General White was driven from Martinsburg to Harper's Ferry on the 11th, and on the morning of the 15th Harper's Ferry surrendered and the entire valley was once more in Confederate possession. When Lee withdrew across the Potomac, after the battle of Antietam, he halted a month on the Opequon and near Winchester; but when McClellan began crossing the Potomac at Berlin, on 25 October, and moved along the east foot of the Blue Ridge, Lee set his troops in motion up the valley, contesting with McClellan possession of the passes leading into the valley, and marching Longstreet's corps through Chester Gap to Culpeper Court House, left Jackson's corps in the valley, near Winchester, with one division at Chester Gap. McClellan was relieved from command of the Army of the Potomac 7 November, and Burnside, who succeeded him, marched from Fredericksburg, and when his advance appeared before that place on the 17th, Jackson withdrew from the valley by way of Swift Run Gap, and joined Lee at Fredericksburg, leaving in the valley a strong brigade of cavalry, supported by a small force of infantry. Union forces now crossed the Potomac and the Confederates were pushed up the valley to New Market, and again the Union troops occupied the lower valley, holding Winchester, Martinsburg and Romney, with outposts at Strasburg, and scouting up the valley of the South branch as far as Monterey. Under cover of this occupation the Baltimore and Ohio Railroad was repaired.

1863.—Active operations in the valley began this year by a Confederate raid from near Staunton to destroy the Baltimore and Ohio Railroad west of New Creek, which resulted in several encounters, and was partially successful, many bridges being burned and the road broken in places as far westward as Clarksburg, W. Va. While these movements were in progress Lee defeated Hooker at Chancellorsville, after which he immediately began preparations for his second invasion of Maryland which culminated in the battle of Gettysburg, and chose the route through the Shenandoah Valley, which offered a safe line of operations, and was held by Union troops not sufficient in number to present a serious obstacle. General Milroy, with about 9,000 men, occupied Winchester, with a brigade in observation at Berryville; General Kelley, with 10,000 men, was at Harper's Ferry; and a detachment of 1,200 men and a battery under Colonel B. F. Smith, at Martinsburg. There were outposts at Romney and also toward Strasburg and Front Royal watching the Confederate cavalry and infantry under General Jenkins in the upper valley. Lee began his movement 7 June by ordering General Imboden, then near Monterey, to move on Romney, by way of the South branch of the Potomac, and directing Jenkins, with his brigade of cavalry, to march down the valley and concentrate at Strasburg or Front Royal, to co-operate with the advance of the army. Ewell's corps, leaving Brandy Station on 10 June, passed through Chester Gap and, marching by way of Front Royal arrived at Cedarville on the evening of the 12th, where Ewell detached Jenkins' cavalry brigade and Rhodes' division of infantry to capture MacReynolds' brigade at Berryville; but MacReynolds, discovering their approach, withdrew to Winchester, which he reached by a roundabout way, on the 13th. Rhodes and Jenkins, avoiding Winchester, pushed on to Martinsburg and, on the 14th, drove Smith and his battery from the place, capturing five guns of the battery that were retiring on the Williamsport road. Smith and his infantry escaped by crossing the Potomac at Shepherdstown Ford and moving to Maryland Heights. Meanwhile Ewell, with the two divisions of Early and Edward Johnson, marched direct on Winchester, surrounded and captured most of Milroy's command on the 15th; after a hard fight, part of those who escaped reached Harper's Ferry and part crossed the Potomac at Hancock. (See WINCHESTER, MILITARY OPERATIONS AT AND NEAR). On the 15th Early crossed the Potomac at Williamsport and Shepherdstown Ford, and occupied Hagerstown and Sharpsburg. On the 17th the garrison at Harper's Ferry was withdrawn to Maryland Heights. Imboden had driven the Union troops from Romney and collected a large herd of cattle, and once more the Valley of the Shenandoah was cleared of Union troops. Lee reported that as the result of these operations Ewell had captured 4,000 prisoners, with their arms, 28 guns, 11 colors, 300 loaded wagons, with their teams and a considerable quantity of stores of all descriptions. After Gettysburg, Lee recrossed the Potomac at Williamsport on the night of 13 July and marched to Winchester and Bunker Hill. When Meade crossed the Potomac south of Harper's Ferry, Longstreet's corps moved up the valley, crossed the Blue Ridge at Chester Gap and marched to Culpeper Court House, where it arrived on the 24th. A. P. Hill's corps followed by the same route, and Ewell's after pursuing Kelley's Union troops west of Martinsburg, found Chester Gap and Manassas Gap held by Meade, who was marching along the east side of the Blue Ridge, and crossing higher up, at Thornton's Gap, joined the army at Culpeper. (See MANASSAS GAP, ENGAGEMENT AT). Again the lower valley was reoccupied by Union troops, and remained in their possession at the opening of the campaign of 1864. Late in the year General Early was put in command of two infantry brigades and some cavalry to hold the upper valley, annoy the Union forces at Winchester, to collect and bring away everything useful to the Union troops or his own, and especially to buy or seize cattle, horses, sheep and hogs, in which the lower valley and that of the South branch abounded. His instructions to do this were carried out to the letter, and the winter of 1863–64 witnessed a most remarkable for-

aging campaign, in which the lower valley and that of the South branch were stripped of thousands of animals. These foraging parties brought on many collisions between the opposing troops.

1864.— In the general movement planned by Grant for the armies under his command in May 1864, General Sigel, who had command in the Shenandoah Valley, was to advance from Harper's Ferry and Winchester up the valley, seize the rich stores of grain, and form a junction with General Crook, who, with cavalry, infantry and artillery was to march from the mouth of Gauley River, West Virginia, to destroy the Virginia and Tennessee Railroad and reinforce Sigel at Staunton, for a movement on Lynchburg. Sigel had about 24,000 men in his command, most of them guarding the railroad from the Monocacy and Harper's Ferry to Parkersburg and Wheeling. He concentrated part of them at Winchester, ordered his cavalry to Cedar Creek and Strasburg and, starting from Winchester 9 May, with 5,500 infantry and artillery, 1,000 cavalry and 28 guns, moved up the Valley. His cavalry had several mishaps and was badly punished and, after a severe defeat of his command by General Breckinridge at New Market, 15 May, he retreated to Cedar Creek. General Hunter relieved him on the 21st and, being reinforced to 8,500 men, advanced upon Gen. W. E. Jones at Piedmont, defeated him there 5 June, and next day occupied Staunton. (See PIEDMONT, BATTLE OF). At Staunton, Hunter was joined by Crook and Averell; he began the work of destruction, thoroughly and quickly completed it, and on the 7th marched on Lynchburg, which he failed to take. He was driven westward by Early, who, with his corps of 8,000 men, had been sent by Lee, 12 June, from Gaines' Mill to expel Hunter from the valley and, if possible, destroy him, and then to threaten Washington. It may here be stated that Hunter, Crook and Averell marched to the Kanawha, and thus left the valley open to Early. On 23 June Early began his return march from the pursuit of Hunter, and reached Staunton on the 27th. He had been joined by Breckinridge's division of infantry, and McCausland's brigade of cavalry. On the 29th he sent the greater part of his cavalry to destroy the bridges of the Baltimore and Ohio Railroad, and with his main body pushed down the valley turnpike, reaching Winchester 2 July. After driving all the Union troops from the lower valley and destroying as much as possible of the railroad and canal, he crossed the Potomac at Shepherdstown, demonstrated on Maryland Heights (q.v.), and marching through Frederick, defeated Gen. Lew Wallace at Monocacy (q.v.) 9 July, and then marched on Washington. Failing to take Washington by surprise, as he had hoped to do, he retraced his steps, recrossed the Potomac at White's Ford on the 14th, and resting two days near Leesburg, moved on the morning of the 16th for the Shenandoah Valley by way of Snicker's Gap in the Blue Ridge; crossed the Shenandoah River at Snicker's Ferry, and on the 17th took up a position near Berryville. Meanwhile Hunter and Crook, who had retreated from Lynchburg to the Kanawha, had come by steamboat and railroad and joined the forces at Harper's Ferry, and on the 18th and 19th engaged Early at Snicker's Ferry and Berry's Ferry without success. During the 19th Early learnt that Averell's division of cavalry, which also had come from the west, was marching from Martinsburg toward Winchester, threatening his rear, whereupon, during the night, he began a retreat to Strasburg. Averell defeated Ramseur's division at Stephenson's Depot on the 20th, which caused Early to move back with one division from Newtown to Winchester; but being threatened by the Union advance from Berryville, he again fell back to Newtown, and on the 21st concentrated his infantry near Middletown. Next day he fell back beyond Cedar Creek and covered all the roads from Winchester. Crook and Averell united their forces at Kernstown, and on the morning of the 24th Early again moved on Winchester, attacked Crook and drove him back, pursuing beyond Winchester. (See KERNSTOWN, SECOND BATTLE OF). Early continued the pursuit next day to Bunker Hill, Crook and Averell recrossing the Potomac. On the 26th Early marched to Martinsburg (q.v.), and devoted the 27th and 28th to the destruction of the railroad; and on the 29th McCausland crossed the Potomac on his noted raid to Chambersburg, Pa. (q.v.). Early remained at Martinsburg and Bunker Hill until 3 August, sending expeditions into Maryland by Williamsport and Shepherdstown fords to Hagerstown and Sharpsburg, collecting horses, cattle and other supplies, then, recrossing the Potomac on the 6th, concentrated at Bunker Hill on the 7th.

Grant had been annoyed and disturbed by these Confederate irruptions and operations in the valley, and had come to the decision that it should be made untenable for either army and had framed instructions for Hunter to drive the Confederates from it and make it a waste, where no army could live. Hunter yielded the command to Sheridan, who took it 7 August and proceeded to carry out Grant's instructions. On the morning of the 10th Sheridan marched his army from Halltown, near Harper's Ferry, toward Early's line of communication, upon which Early abandoned Winchester on the 11th and fell back to Cedar Creek, followed by Sheridan next day. At Cedar Creek Early received reinforcements — a division of infantry, two brigades of cavalry, and a battalion of artillery from Lee's army, all under command of Gen. R. H. Anderson — and resumed the offensive so aggressively with his cavalry, bringing on several sharp encounters, that Sheridan withdrew his infantry on the night of the 16th, his cavalry following next day, driving all the livestock in that part of the valley before it, and burning the grain from Cedar Creek to Berryville, near which Sheridan had taken position. Early pursued Sheridan on the morning of the 17th, struck and routed part of his command near Winchester, drove it through the town, and on the 21st moved with his whole army to attack Sheridan at Berryville. That night Sheridan, after some sharp encounters with Early's advance, fell back to Halltown. For three days Early demonstrated on Sheridan's position, then, leaving one division in front of Sheridan, marched on the 25th, with four divisions and his cavalry, to Lee Town and toward Sheperdstown, his cavalry pushing on to Williamsport. Beyond Lee Town, Early met and engaged Torbert's cavalry

and drove it back to Sheperdstown. (See SHEPHERDSTOWN, ENGAGEMENTS AT). Early remained that night at Shepherdstown, where he was joined next day by his cavalry, which had demonstrated on Williamsport, and the command returned to Winchester. On August 28 Sheridan advanced his infantry to Charlestown. Merritt's cavalry division, going by way of Lee Town, drove the Confederate cavalry from that place to Smithfield and across the Opequon. Next day Early drove Merritt back through Smithfield, but was checked and driven back himself across the Opequon by a division of Sheridan's infantry. (See SMITHFIELD, ENGAGEMENT AT AND NEAR). There were now several minor encounters and counter demonstrations, and on the morning of September 19 Sheridan crossed the Opequon and in a hard-fought battle defeated Early, who retreated to Newtown and Fisher's Hill, near Strasburg. (See OPEQUON, BATTLE OF THE). Sheridan followed on the 20th, and on the 21st again defeated Early at Fisher's Hill (q.v.), pursuing his retreating troops during the night and next day to Mount Jackson. Beyond New Market, Early abandoned the valley pike and took a road leading to Port Republic. Sheridan, not having his cavalry with him, halted until it came up on the 25th, when it advanced to Staunton and Waynesborough, destroying the railroad between the two places, but, being threatened in flank and rear by Early, fell back, burning mills, storehouses, barns, grain and forage, driving before them all livestock and devastating the whole width of the valley from Staunton northward. On the return march Sheridan's cavalry was harassed by that of the Confederates, who were turned upon and routed at Tom's Brook, October 9, when Sheridan resumed his march down the valley, halting on the 10th on the north side of Cedar Creek. Early had followed, and on the morning of October 19 fell upon Sheridan's army and drove it back in some disorder, but it was rallied near Middletown and, resuming the offensive, defeated Early, who retreated to New Market. (See CEDAR CREEK, BATTLE OF). This practically ended the valley campaign of 1864. There were numerous raids and cavalry encounters, but no general movements or heavy engagements. Early remained in the vicinity of New Market until December 16, when he fell back to near Staunton, and Sheridan went into winter quarters at Kernstown. Between the two there was no subsistence for man or beast; the valley had been desolated. One of Early's staff records in his diary that from the time of Early's appearance in the valley late in June till the middle of November he had marched 1,670 miles and had 75 battles and skirmishes.

1865.—During the winter the greater part of Early's command was sent to Lee at Petersburg, leaving Early a very small force of infantry and cavalry. On February 27, Sheridan, with two well-equipped divisions of cavalry of 5,000 men each, started from Winchester on the last campaign up the Shenandoah Valley, and with but little opposition reached Staunton, Early falling back to Waynesborough. The work of destruction at Staunton was completed, and Early was followed to Waynesborough, where on March 2 his command of 1,800 men was defeated and dispersed, most of them being captured, with all their colors, 11 guns and train. (See WAYNESBORO, BATTLE OF). Sheridan then moved unmolested to the Virginia Central Railroad, which he destroyed for miles, and marched to White House, on the Pamunkey River, where he arrived March 19, and then moved to join Grant's army before Petersburg.

There is no area upon which the armies contended that witnessed more brilliant strategy, fertility of resource, more rapid and exhausting marches, and more gallant fighting than that enclosed by the Alleghany Mountains and the Blue Ridge. H., *Sheridan's Veterans* (Boston 1883–86); Kellogg, S. C., *The Shenandoah Valley and Virginia, 1861–65* (New York 1903); Ashby, T. A., *The Valley Campaigns* (New York 1914); and The Century Company's *Battles and Leaders of the Civil War.*

SHENSHIN, Afanasi Afanasievich. See FET, AFANASI AFANASIEVICH.

SHENSI, cradle of Chinese civilization, is the most easterly province of China's Northwest, with an area of about 73,000 square miles. Its territory is part of the great area, roughly oblong, formed by the northward bend of the Yellow River, which marks Shensi's eastern border until the river turns east. It is traversed by the Peiling range which separates the basins of the Yellow and Yangtze rivers. The province is watered mainly by the Wei and other Yellow River tributaries, and in the south by the Han, part of the Yangtze system. But Shensi agriculture depends on irrigation, and the province is known for its canals, ancient and modern. It is one of the important food-producing provinces of the Northwest. Its chief crops are: wheat, barley, kaoliang, rice, and cotton. It also produces a large quantity of wool. Shensi's oil resources include about two thirds of China's oil reserves, and its coal reserves are next to the largest in China. Other minerals include gold, iron, and salt. Sian, the capital, is the most important city. Yenan, a small town in the north, capital for more than a decade of the Communist northwest border region, was captured by national government forces in the spring of 1947. Pop. (official est. 1945–1946) 9,649,168.

SHENSTONE, William, English poet and landscape-gardener: b. Halesowen, Worcestershire, Nov. 13, 1714; d. there, Feb. 11, 1763. He was educated at Oxford, and intended entering a profession, but on inheriting his father's estate, Leasowes, lived in retirement upon it, devoting his life to beautifying it and to writing poetry, including *The Schoolmistress* (1742), *Pastoral Ballad* (1743), and the stanzas *Written in an Inn.* His complete works were published by Robert Dodsley, 3 vols. (1764–69); 20th century editions include the songs (Chelsea, England, 1930), essays (*Men and Manners,* edited by Havelock Ellis, Waltham Saint Lawrence 1927), and letters (edited by Marjorie Williams, Oxford 1939); and a biography by A. R. Humphreys appeared in 1937 (Cambridge, England). Walpole called him "that water-gruel bard" who, laboring a lifetime, never wrote a perfect song.

SHEOL, shē'ōl, a Hebrew word signifying the place of the dead. Wherever it occurs in

the Hebrew text it is rendered in the authorized English version by «grave» or by «hell,» or by «pit.» In the revised version «Sheol» is generally left untranslated in the text, while «grave» is put in the margin. (See HADES; HELL). Consult Jastrow, M. (in *American Journal of Semitic Languages,* Vol. XIV, Chicago 1898); Jensen 'Die Kosmologie der Babylonier' (Strassburg 1890); Schroder, 'Die Keilinschriften und der alte Testament' (Berlin 1902).

SHEPARD, Charles Upham, American mineralogist: b. Little Compton, R. I., 29 June 1804; d. Charleston, S. C., 1 May 1886. He was graduated from Amherst in 1824 and made a special study of botany and mineralogy in the following year. He was lecturer on natural history at Yale in 1830–47, occupied the chair of chemistry at the Medical College of South Carolina in 1854–61 and resumed it a few years after the Civil War. He was professor of chemistry and natural history at Amherst in 1845–52, and from 1852–77 was lecturer on natural history, after which he was made professor emeritus. His investigations resulted in the discovery of a new species of microlite in in 1835, of warwickite in 1838, and of danburite in 1839, and he was also the discoverer of valuable deposits of phosphate of lime near Charleston which have proved of great value to agriculture, and their use in the manufacture of superphosphate fertilizers has made an important addition to the chemical industries of South Carolina. His collection of minerals was at one time the best in the country, but was unfortunately partially destroyed by fire three years after its purchase by Amherst in 1877. In addition to his numerous scientific papers his publications include 'Report on the Geological Survey of Connecticut' (1837); 'Treatise on Mineralogy' (1855), etc.

SHEPARD, Edward Morse, American lawyer: b. New York, 1850; d. 28 July 1911. He was graduated from the College of the City of New York in 1869, studied law and was admitted to the bar. He established a practice in Brooklyn, and was an active member of the Democratic party there, being one of the organizers of the Young Men's Democratic Club of Brooklyn. He held no public office except as member of the civil service commission of the city in 1883–85, and chairman of that commission in 1888–90. In 1884–85 he was a State forestry commissioner, and was the author of the commission's report for that year. In 1901 he was the regular Democratic nominee for mayor of Greater New York, but was defeated by Seth Low. For several years he was counsel for the New York Rapid Transit Commission, and resigned that position in March 1904 to become general counsel for the Pennsylvania Railroad. He wrote 'Martin Van Buren' (in American Statesmen Series; rev. ed., 1900); 'Dishonor in American Public Life' (1882); 'The Work of a Social Teacher' (1884).

SHEPARD, Helen Miller (GOULD), American philanthropist: b. New York, 20 June 1868; d. 21 Dec. 1938. She was a daughter of the late Jay Gould (q.v.), and achieved fame through her benefactions for charitable and other uses. At the opening of the war with Spain she not only contributed $100,000 to the United States government, but was active in the Woman's National War Relief Association, to which she was a generous contributor. Among other notable gifts of hers are the library of New York University; $50,000 to the naval branch of the Young Men's Christian Association of Brooklyn; and $100,000 to New York University, for a Hall of Fame for Great Americans, in 1900. She married Finley Johnson Shepard 22 Jan. 1913; was a member of the board of the Russell Sage Foundation and of the national board Y. W. C. A.

SHEPARD, Thomas, English Puritan divine: b. Towcester Northamptonshire, 5 Nov. 1604; d. Boston, Mass., 25 Aug. 1649. He was graduated at Emmanuel College, Cambridge, in 1623, and after taking his A.M. there in 1627 he became a preacher at Earles-Colne. His practices, however, displeased Bishop Laud and he was forbidden to preach within the diocese of London. He was later chaplain to Sir Richard Darly in Yorkshire, and afterward was called to the ministry at Heddon Northumberland. Through his non-conformity he was again silenced, this time by Archbishop Neile. He went to Boston in 1635, and was ordained pastor at Newton, now Cambridge. He was active in founding Harvard College and secured its location at Cambridge. He was also instrumental in establishing an Indian Mission. His religious writings attained a considerable reputation. Author of 'The Sincere Convert' (1641); 'The Sound Believer' (1645); 'Theses Sabbaticæ' (1649), etc.

SHEPARD, William, American soldier: b. Boston, Mass., 1 Dec. 1737; d. Westfield, Mass., 11 Nov. 1817. He enlisted in the provincial army at the outbreak of the French and Indian War and served until 1763, participating in the battles of Fort William Henry and Crown Point and attaining rank as captain. He entered the Continental service at the beginning of the American Revolution, became colonel in 1777 and served until the close of the war. He was engaged in 22 battles and won a high reputation for his courage and ability. In 1788–90 he was a member of the executive council and as brigadier-general in command of the militia he defended the arsenal in Springfield at the time of Shays' Rebellion in 1786. He was afterward promoted major-general of militia and in 1797–1803 served as member of Congress.

SHEPHARD, Elliot Fitch, American lawyer and journalist: b. Jamestown, N. Y., 25 July 1833; d. New York, 24 March 1893. He was graduated at the University of the City of New York in 1855 and was admitted to the Bar in 1858, afterward engaging in practice in New York. At the outbreak of the Civil War he was appointed aide-de-camp to Governor Morgan, with rank of colonel, and was assigned to recruiting service. He raised the 51st New York Volunteers, known as Shephard's Rifles, and was instrumental in enlisting a total of about 50,000 men. He founded the New York Bar Association in 1876 and remained in practice in New York until 1884. He bought the *Mail and Express,* New York, in 1888, thereafter editing it. He bitterly opposed Sunday traffic and travel and as owner of the Fifth Avenue stage line retused to permit its operation on Sunday.

SHEPHEARDES CALENDER, The. *The Shepheardes Calender* was published anonymously in 1579, with a dedication "To the noble and vertuous gentleman most worthy of all titles both of learning and chevalrie, M. Philip Sidney." The book consists of 12 eclogues, each eclogue accompanied by a commentary or glossary that gives the argument and the meaning of unusual words; and purports to be written by E. K., a friend of the poet's identified by some scholars with Edmund Kirke, a college mate of Spenser's, and by others with Spenser himself. The whole is introduced by a "General Argument" and an epistle to Master Gabriel Harvey of Cambridge. The *Calender* was an immediate success. It went through five editions during Spenser's lifetime, the first in 1579, and then in 1581, 1586, 1591, 1597; and was regarded as one of the high-water marks of English poetry. *The Shepheardes Calender* is descended from many sources. From the eclogue end its origins were in Theocritus most of all, and to varying degrees in Bion, Virgil, Petrarch, and Boccaccio, Spagnuoli, Sannazaro, and Marot. In meters and rhythms, of which Spenser attempts a wide variety, his main sources are Chaucer in particular, Surrey, Marot, and the old ballads. The language of the book marks Spenser as a daring innovator in poetic diction. It consists of words and forms from Lancashire and other dialects, of colloquialisms, old literary words, obsolete expressions, the best of contemporary poetic diction, and coinages in words and in forms, often happy, sometimes far-fetched, of Spenser's own.

The single eclogues employ the traditional devices: the monologues, the two- and three-part dialogues, the singing contests and the stories. The scheme of an eclogue to the month; following the general plan of country almanacs was original. But this motive is followed only indifferently; in October not at all, quite fully in the January, February, November and December divisions. In like manner the romance of Colin's love for Rosalynd also runs through some of the eclogues and is absent from others. The two motives combine to make the framework of the poem.

There is probably no one book in English that looks in so many poetic directions as *The Shepheardes Calender*. It is the work of a young writer possessed of enthusiasm, the splendor and excitement of the Renaissance, wide taste and reading, and one of the supreme lyrical gifts in all poetry for tone, rhythm, ornament and the enveloping glamor of a beautiful and rare spirit and mentality. Most of Spenser's later work finds its beginnings in the *Calender;* and though he progressed far beyond it in every way, in profundity of content, in rhythm and imagery, the progression was in almost every case directly from the qualities of his first work. As the poet's poet, which he undoubtedly is, Spenser stands from the first revealed. In *The Shepheardes Calender* lovers of Milton will find many of his qualities predicted, and to a varying extent the same is true of Shakespeare, Keats, Chatterton, Blake, Coleridge, Wordsworth and Tennyson, to mention only a few of Spenser's debtors.

STARK YOUNG.

SHEPHERD, Francis John, Canadian physician: b. Cavagnol, Quebec, Nov. 25, 1851; d. Jan. 18, 1929. He was graduated M.D. at McGill University in 1873 and later studied in England, France, Germany and Austria. He was associated with the medical faculty at McGill from 1875 and from 1883–1914 was professor of anatomy there, acting as dean of the medical faculty in 1908–14. He was consulting surgeon to the Montreal General and Royal Victoria hospitals. He was joint author of *American Text-Book of Surgery* (1892); *Retrospect of Surgery* 3 vols., (1881–94) and editor of *Robert Craik's Addresses* (1907).

SHEPHERD, William Robert, American historian and educator: b. Charleston, S. C., June 12, 1871; d. June 7, 1934. He was graduated at Columbia University in 1893 and later studied at the universities of Berlin and Madrid. He was a member of the faculty at Columbia from 1902 and from 1912 was professor of history there. He specialized in United States colonial history and in that of Latin America. He was honorary professor of the University of Chile. Author of *History of Proprietary Government in Pennsylvania* (1896); *Battle of Harlem Heights* (1898); *The Cession of Louisiana to Spain* (1904); *Passing of New Amsterdam* (1912); *Central and South America* (1914); *Latin America* (1914); *Expansion of Europe* (1915); *Common sense in Foreign Policy* (1917); and *Hispanic Nations of the New World* (1919). His *Historical Atlas* (1911) is the book by which generations of undergraduates have known him.

SHEPHERD'S PURSE, a small cruciferous weed (*Capsella bursa-pastoris*). It has rosettes of lobed or pinnatifid leaves, a short stem, branching into spreading pedicels carrying racemes of small white flowers, rapidly succeeded by triangularly heart-shaped capsules, which have suggested this name and also those of mother's heart, caseweed, shepherd's bag, etc., by their resemblance to ancient wallets. Originally European, this plant has been naturalized throughout the temperate regions, blooming during the entire year.

SHEPHERDSTOWN, town, West Virgina, in Jefferson County; altitude 402 feet; on the Potomac River; 16 miles southwest of Hagerstown, Md., and 74 miles west of Washington, D.C.; on the Norfolk and Western Railroad. Dairy farming and fruit growing, and the packing and storage of apples are its industries. It is the seat of Shepherd College, a state institution with an enrollment of about 450. Settled in 1732 and incorporated in 1762, this is the oldest town in West Virginia. The first house built in the state is here. The original settlers, Germans from Pennsylvania, called the place Mecklenburg; the name was changed upon incorporation, in honor of Thomas Shepherd, the founder. Here, in 1787, the inventor James Rumsey (q.v.) gave a public showing of his steamboat; his log cabin was preserved, and a monument erected in his honor. The town has had mayor and council government since 1794. Pop. (1950) 1,173.

SHEPHERDSTOWN, Engagements at and Near. Situated in a great bend of the Potomac, nine miles east of Martinsburg and on one of the principal routes from the Shenandoah Valley to Maryland, Shepherdstown, W. Va., was the scene of much activity during

the Civil War. Both armies, at various times, crossed the Potomac at a ford about one mile below the town, which was used by the Confederates when they withdrew from the Antietam battlefield, 18–19 Sept. 1862, and by a great part of Lee's infantry when they marched to Gettysburg in June 1863. On 25 Sept. 1862 General Pleasonton's cavalry division crossed the ford on a reconnaissance toward Martinsburg and a few miles beyond Shepherdstown encountered the Confederates in some force, and was checked after capturing a few men. Again (1 Oct. 1862) Pleasonton crossed the river, with 500 cavalry and a battery of six guns, drove the Ninth Virginia cavalry from Shepherdstown and pursued it across the Opequon and into Martinsburg, where he encountered the rest of Col. W. H. F. Lee's brigade and a battery, both of which were driven from the place. Pleasonton remained in the town until 5 P.M., when he started on his return march, followed by Confederate cavalry and two guns, with whom about dark he had an encounter when within a mile of Shepherdstown, after which he recrossed the Potomac. The loss was slight on both sides. On 16 Oct. 1862 in co-operation with General Hancock's division, which advanced from Harper's Ferry toward Charlestown and Winchester, General Humphreys, with about 500 cavalry, 6,000 infantry and six guns, marched from Sharpsburg, crossed Shepherdstown Ford at 4 A.M., and moved toward Smithfield on a reconnaissance. A mile out of Shepherdstown his advance was contested by Fitzhugh Lee's cavalry brigade and two guns. Lee was driven beyond Kearneysville, where he was reinforced by cavalry and a brigade of infantry, but was driven back, and Humphreys went into bivouac. The latter resumed his march on the morning of the 17th, and one and a half miles beyond Kearneysville came upon Lee in a strong position. Not desiring to bring on an engagement, and having his cavalry make a dash on Smithfield, which was found occupied by Confederate cavalry, Humphreys returned to Sharpsburg by the way he had gone out, followed by cavalry and artillery as far as Shepherdstown.

After his Gettysburg campaign, Lee recrossed the Potomac at Williamsport 14 July 1863. On that day, to watch his movements, General Gregg's cavalry division was sent across the Potomac at Harper's Ferry, and on the 15th marched to Shepherdstown, driving some cavalry from the town that evening and encamping nearby. On the 16th, about 1 P.M., Gregg's advance near Kearneysville was attacked by Fitzhugh Lee, with his own and Chambliss' brigade, supported by Jenkins' brigade. Gregg was gradually driven back upon his guns, when he rallied his command, and the sharp engagement was continued, lasting until dark, both sides dismounted. This engagement was on the Boteler farm, about a mile from town. During the early morning Gregg fell back to Harper's Ferry, with a loss of 70 killed, wounded and missing as the result of his fight on the 16th. The Confederate loss was 106.

On 21 Aug. 1864 Sheridan fell back from the line of the Opequon to Halltown, near Harper's Ferry, the cavalry, under General Torbert, being moved to his right at and near Shepherdstown. General Early demonstrated on the position at Halltown for three days, and on the 25th with the four infantry divisions of Rodes, Ramseur, Gordon and Wharton, with their artillery, moved northward toward Shepherdstown, his cavalry at the same time moving on Williamsport to keep up the impression of an invasion of Maryland and Pennsylvania. Between Lee Town, seven miles southwest of Shepherdstown and Kearneysville, Early came upon Merritt's and Wilson's cavalry divisions, under Torbert, who had marched from Shepherdstown and Duffield's that morning on a reconnaissance to Lee Town. Torbert promptly attacked Wharton's division, Early advanced and drove it back in confusion nearly a mile. Early brought up the rest of his command, and after a short and sharp contest in which artillery was freely used, Torbert ordered his two divisions to fall back, Wilson's by the route it had come, and Merritt's by the direct road to Shepherdstown. Merritt was followed so closely by Early that when near Shepherdstown on the Charlestown road, Custer's brigade was ordered out to repel the advance, in which it succeeded, driving it back; but it was in turn struck in flank and rear by Gordon's division, which had marched across the country. Devin's brigade was sent to Custer's relief, and engaged Gordon. Custer was cut off and, after a sharp fight, made his escape by crossing the Shepherdstown Ford into Maryland. It was now dark; Merritt rejoined Wilson and both joined Sheridan. The loss was considerable on both sides. Early encamped near Shepherdstown, and next day moved back across the Opequon, and on the 27th to Bunker Hill. (See CIVIL WAR IN AMERICA). Consult Dandridge, Mrs. D., 'Historic Shepherdstown' (Charlottesville, Va., 1910).

E. A. CARMAN.

SHEPHERDSTOWN (Boteler's) **FORD Engagement at.** General Lee withdrew from the field of Antietam during the night of 18 Sept. 1862 and recrossed the Potomac into Virginia by the Shepherdstown or Boteler's Ford, one mile below Shepherdstown and about two and one-half miles from Sharpsburg. Leaving some artillery and two small infantry brigades at the ford to hold McClellan in check, he marched his army for the Opequon. On the morning of the 19th Pleasonton's cavalry followed Lee to the Potomac, and in the evening detachments of the Fifth corps forded the river, drove away the Confederate infantry, and seized some of the artillery. To ascertain how far Lee had retreated, General Porter was authorized by McClellan to send a reconnaissance beyond the Potomac on the morning of the 20th, and Porter ordered over the divisions of Generals Morell and Sykes. Before daylight two regiments crossed with spare horses, secured three guns that had been taken the night before, and took them to the Maryland side. At 8 o'clock Sykes crossed the river with Lovell's brigade of regulars and pushed out a mile on the Charlestown road, when he discovered the Confederates in force, upon which Lovell fell back, skirmishing, to the heights near the river, and Warren's small brigade of two regiments formed on his left. The Confederates encountered were Gen. A. P. Hill's division of six brigades, supported by three brigades under

General Early, all sent back by Lee when he heard that the Union advance had crossed the river. Hill's skirmishes had slowly pressed back Lovell, and meanwhile Barnes' brigade of Morell's division had crossed the river, under orders to go on the road to Shepherdstown; but Sykes ordered it straight to the top of a high steep bluff on the river bank to connect with Lovell's right. Before Barnes' brigade had all taken position Sykes came to the conclusion that he was too largely outnumbered to remain on that side of the river, and ordered the troops to recross, which was done by the left in good order, under cover of a heavy artillery fire from the Union batteries on the Maryland side; but the withdrawal on the right was not accomplished without disaster. The 118th Pennsylvania or "Corn-Exchange" regiment, 737 officers and men, had ascended the high bluff, and was not fairly in position when it was attacked by five brigades of A. P. Hill's division. It made a good fight, but was attacked on both flanks and in front, Colonel Prevost was wounded, and the regiment was driven in disorder over the precipitous rocky bluff, many being killed and wounded in falling to the roadway below. The men began to cross the river, and the Confederates, advancing to the bluff, fired upon them as they were struggling to regain the opposite shore. Some were killed in the water; some were drowned; others, who took refuge in old lime kilns on the bank of the river, were killed or wounded by careless firing of the Union batteries; and some surrendered. In this disastrous affair the regiment lost 53 killed, 10 wounded and 105 missing, or 269 out of a total brigade loss of 317. A. P. Hill's loss was 30 killed and 231 wounded. The Union loss on the 19th and 20th was 71 killed, 161 wounded and 131 missing; the Confederate loss, 33 killed and 252 wounded. After the engagement of the 20th A. P. Hill and Early marched from the field and joined the main body of the army, which bivouacked that night on the Opequon near Martinsburg.

SHEPPARD, Edmund Ernest, Canadian journalist: b. South Dorchester, Ontario, Sept. 29, 1855; d. California, Nov. 6, 1924. After attending Bethany College, West Virginia, he spent some years as a journalist in the southern United States. Following his return to Canada he became editor of the Saint Thomas *Journal,* 1881–1883, and editor in chief of the Toronto *News,* 1883–1887. In 1887 he founded the Toronto *Saturday Night,* and he served as its editor until 1906; during 1895–1897 he was also owner and editor in chief of the Toronto *Star.* He represented the Dominion government on a commercial mission to Latin America in 1897. Besides his journalistic work, he wrote several novels, among them *Dolly* and *The Widower Jones.*

SHEPPARD, John (known as JACK), English criminal: b. Stepney, near London, December 1702; d. London, Nov. 16, 1724. Brought up in the workhouse at Bishopsgate, he ran away from the carpenter to whom he had been apprenticed and, incited by Bess Lyon ("Edgeworth Bess"), took to a life of thieving and robbery. Several times imprisoned, on each occasion he made his escape with characteristic audacity. He was at the summit of his career when he fell into the custody of Jonathan Wild, a broker of stolen goods, who gave him up to justice on July 23, 1724. Tried at the Old Bailey and condemned to death, before his execution was effected he escaped twice from prison. He was hanged at Tyburn in the presence of 200,000 people, his body being buried in the churchyard of St. Martin's-in-the-Fields. His career furnished the theme for several plays and books, notably the *Jack Sheppard* (1839) of Harrison Ainsworth (q.v.). Sir James Thornhill (q.v.) painted his portrait in Newgate prison.

SHEPPARD, Morris, United States Senator: b. Wheatville, Texas, May 28, 1875; d. Washington, D.C., April 9, 1941. He took law degrees at the University of Texas, 1897, and Yale, 1898, and practiced law from 1899 at Texarkana, Tex. For almost 39 years he served continuously in Congress, during 1902–1913 in the House of Representatives and thereafter in the Senate. He drafted the Senate resolution from which derived the 18th (Prohibition) Amendment, and in 1921 he was cosponsor of the Sheppard-Towner Act which provided for federal and state cooperation toward maternal and infant welfare and hygiene. As chairman of the Military Affairs Committee he was closely associated with the administration's preparedness program.

SHEPSTONE, shĕp'stŭn, SIR **Theophilus,** British South African statesman: b. near Bristol, England, Jan. 8, 1817; d. Pietermaritzburg, Natal, June 23, 1893. At the age of three he was taken by his father, a missionary, to Cape Colony, where, as he grew up, he acquired a close understanding of the native peoples. He was an interpreter with British forces in the Kaffir War of 1835 and in the occupation of Port Natal (later Durban) three years later, and was then appointed "diplomatic agent" to a number of tribes in Natal. From 1856 till 1877 he was secretary for native affairs in the colonial government of Natal, in this capacity creating reserves for native settlement and giving considerable administrative authority to the chiefs. As a result of his influence Cetewayo (q.v.) was proclaimed king of the Zulus in 1872, but the latter soon abandoned his promises to live at peace with his neighbors and by 1876 was threatening the security of the South African Republic (Transvaal). At this juncture Shepstone was sent into the Transvaal, the government of which was practically bankrupt and menaced by other tribes in addition to the Zulus, and on April 12, 1877, he issued a proclamation annexing the country.

SHERATON, shĕr'ă-t'n, **Thomas,** English furniture designer and cabinet maker: b. Stockton-on-Tees, 1751; d. London, Oct. 22, 1806. He was apprenticed to a cabinet maker, and was self-taught in drawing and geometry. About 1790 he settled in Soho Square, London, and there began the publication of the books of furniture designs which place him in the front rank of English furniture designers. There is no evidence that he had a shop of his own, and very little of his work is known to be in existence. He made a scanty living through the sale of his books, by teaching drawing, occasional preaching in Baptist chapels, and the publication of a number of religious books. He failed to

achieve much success as a practical cabinetmaker, but his early furniture designs had far-reaching influence and were widely copied. It was his theory that beauty in furniture lies in utility worked out through sound lines of construction. His later work shows an unfortunate departure from the rules laid down at the beginning of his career, for his natural inventiveness was tempted by the vogue of the French Empire style. In exploiting this, he departed from the beauty and simplicity of line of his earlier work. His books of designs are *The Cabinet-maker and Upholsterer's Drawing-book* (111 plates, 1791; 2d ed., 119 plates, 1793–96; 3d ed., 122 plates, 1802); *The Cabinet Dictionary* (1803); *The Cabinet-maker and Artist's Encyclopedia* (30 parts, 1804–06). The last work was planned in 125 parts, but only 30 were completed before his death. See also FURNITURE.—*English* (Sheraton [1790–1810]).

SHERBROOKE, shûr'brŏŏk, SIR **John Coape**, English soldier: b. England, 1764; d. Calverton, Nottinghamshire, Feb. 14, 1830. He was commissioned ensign in the army in 1780, served as captain in Nova Scotia in 1784–1785, as lieutenant colonel in the latter part of the Netherlands campaign in 1794, and in 1796–1800 in India and South Africa. Promoted major general in 1805, he was sent to Egypt to negotiate a treaty with the beys in 1807, and in 1808 was in temporary command of the British troops in Sicily. In the Peninsular War he was second in command to Arthur Wellesley (later duke of Wellington) in the campaign of 1809, and was awarded a medal for his gallant conduct at Talavera de la Reina. Promoted lieutenant general in 1811, he was appointed lieutenant governor of Nova Scotia, and in 1814 led a naval expedition to Maine, capturing various points on the Penobscot River. He became captain general in 1816 and governor general of Canada, but resigned in 1818 after a paralytic stroke and returned to England. For the remainder of his life he lived in retirement.

SHERBROOKE, VISCOUNT. See LOWE, ROBERT.

SHERBROOKE, city, Quebec Province, Canada. The county seat of Sherbrooke County, it is located at the junction of the Magog and St. Francis rivers about 80 miles east of Montreal and 30 miles north of the United States boundary, in a section of Quebec known as the Eastern Townships. It is served by the Canadian National and the Canadian Pacific railroads, and is a terminus of the Quebec Central and the Boston and Maine railroads. At Windsor Mills, 11 miles distant, is an airport. The city is the cultural and commercial center of a lumber, dairy, and cattle region which has copper and asbestos mines. The leading manufactured products are industrial machinery, rayon, cotton yarn and cloth, hosiery, and condensed milk. Abundant power is provided by municipally owned power plants. A Roman Catholic college and seminary here are affiliated with the University of Montreal. Sherbrooke was settled late in the 18th century by loyalists from Vermont and New Hampshire and colonists from the British Isles. In 1794 it was known as Hyatt's Mills. When incorporated as a town in 1857, it was named for Sir John Coape Sherbrooke, governor general of Canada (1816–1818). In 1875 it was incorporated as a city. Pop. (1951) 50,543.

SHERE ALI or **SHER ALI**, shār'ŭ'lē (also **SHERE ALI KHAN**), amir of Afghanistan: b. 1825; d. Mazar-i-Sharif, Afghan Turkistan, Feb. 21, 1879. A son of Dost Mohammed Khan, he succeeded him as amir in 1863. At first friendly to the British, he turned against them when they failed to guarantee his rule, and his hostile acts brought on the Second Afghan War (1878–1881). Defeated by the British (1878), he fled to Turkistan, where he died. He was succeeded as amir by his son, Mohammed Yakub Khan (q.v.).

SHERIDAN, shĕr'ĭ-d'n, **Philip Henry**, American soldier: b. Albany, N. Y., March 6, 1831; d. Nonquitt, Mass., Aug. 5, 1888. After graduation from the United States Military Academy at West Point (1853), he served in the 1st and 4th Infantry regiments in the West until May 1861, when he was appointed captain in the 13th Infantry. In December 1861 he was made quartermaster and commissary of the Union Army in southwestern Missouri, and was Gen. Henry W. Halleck's quartermaster during the Corinth campaign in 1862. In May 1862 he was appointed colonel of the 2d Michigan Cavalry and was made brigadier general of volunteers in July. He served with distinction in the battles of Perryville and Stone River, and was made major general of volunteers Dec. 31, 1862. In 1863 he distinguished himself in the Battle of Chickamauga and also bore an important part in the Battle of Chattanooga, where he attracted the attention of Gen. Ulysses S. Grant. When Grant took command in Virginia, he had Sheridan transferred (April 1864) to the Army of the Potomac as commander of cavalry.

Sheridan was actively engaged in the battles of the Wilderness, Spotsylvania Court House, Cold Harbor, and other actions. From May 9 to 25, 1864, his corps raided the Confederate communications around Richmond, destroying 10 miles of track on three important railroads, cutting the telegraph wires, capturing several trains, and causing much alarm in the Confederate capital. On May 28 he fought the Battle of Hawes's Shop, and on June 11 that at Trevilian Station. Nearly every day in May, June, and July Sheridan's cavalry was engaged with the Confederate troops or raiding their communications. On Aug. 7, 1864 he was placed in command of the Army of the Shenandoah with instructions to clear the valley. He defeated Gen. Jubal A. Early at Winchester and at Fisher's Hill in September, and was rewarded by being made a brigadier general in the Regular Army. After the Battle of Fisher's Hill he laid waste the Shenandoah Valley. Practically everything destructible was destroyed and the horses, cattle, and sheep were driven out. His object was to prevent future expeditions by the Confederates up the valley by destroying the means of subsistence; but because the noncombatants were reduced to the verge of starvation, Sheridan was much censured for his course. On Oct. 19, 1864 his army was surprised and routed in the Battle of Cedar Creek by Early, who neglected to pursue. Sheridan, who was 20 miles away when the battle began, made his famous ride, rallied his troops, and decisively defeated Early. On Nov. 8, 1864 Sheridan was made major general in the Regular Army. From February 27 to March 24, 1865 he raided from Winchester to Petersburg, cutting three railroads, two canals, telegraph wires, destroying supplies, and leaving only one line of railroad by which supplies could

be brought to Lee's army. During this raid he defeated Early again at Waynesborough (q.v.). At Five Forks (q.v.) 1 April Sheridan turned Lee's flank, forcing him to evacuate Petersburg and begin the retreat to Appomattox. In the pursuit of Lee, Sheridan took a leading part, and when he had placed his army squarely across the Confederate line of march at Appomattox Court House the surrender took place (9 April).

From May 1865 to March 1867 Sheridan commanded the Military Division (later Department) of the Gulf. His strong force on the Mexican border encouraged the Liberals and forced the French to withdraw their support from Maximilian. In his 'Personal Memoirs' Sheridan states that material assistance was secretly given by the United States authorities to the Liberal army under Juarez, 30,000 muskets at one time being sent to the latter from the United States arsenal at Baton Rouge. After the passage of the reconstruction acts, in March 1867, Sheridan was placed in command of the fifth Military District, consisting of Louisiana and Texas, with headquarters at New Orleans. His career as military governor was a stormy one. He was in favor of radical measures in dealing with the conquered Southerners, and in the troubles that arose in his district he was supported by General Grant and opposed by President Johnson, who sent several messengers to him in the endeavor to influence him to a more moderate course. Sheridan, believing that severe measures were necessary, refused to conform to the suggestions of the President's agents, and Johnson, after Sheridan's wholesale removal of civil officers, relieved him from command of the Fifth Military District in September 1867. General Grant strenuously protested, but Johnson was firm and Sheridan was transferred to the Department of the Missouri. In 1869, when General Grant became President, Sheridan was made lieutenant-general. In 1870–71 he was with the German armies observing the campaigns of the Franco-German war; in 1875 was again sent to New Orleans on account of the political riots in that city; in 1878 commanded the Western and Southwestern Military Divisions; in 1883 succeeded Sherman as commander-in-chief of the army; and in 1888 was made general. In person, General Sheridan was short and stout, with rather harsh features. In manner he was gruff, but not unkind. He was trusted by his soldiers, who called him «Little Phil» and believed him invincible. He married, in 1879, Miss Rucker, daughter of Gen. D. H. Rucker of the United States army. In religion, General Sheridan was a devout Roman Catholic. He always refused to enter politics. An equestrian statue has been erected in his honor at Albany, N. Y.

Consult Sheridan, 'Personal Memoirs' (1888); Davies, 'General Sheridan' (1895); Newhall, 'With General Sheridan in Lee's Last Campaign' (1866).

WALTER L. FLEMING,
Late Prof. of History, Vanderbilt University.

SHERIDAN, Richard Brinsley, English dramatist, orator and statesman: b. Dublin, Ireland, 30 October 1751; d. London, 7 July 1816. His father, Thomas Sheridan, was an actor; his mother was a dramatist and novelist. At the age of seven he was taken to London. From 1762 to 1768 he attended Harrow school, where, in collaboration with a fellow-pupil named Halhed, he wrote a farce called 'Jupiter.' In 1771 he moved to Bath, where he learned at first hand the foibles of the fashionable world. Among the people that he met was the eminent composer, Thomas Linley. Linley's daughter, well-known as a singer, was a lovely and coquettish girl with many admirers. To shield her from the persecutions of a Major Mathews, Sheridan arranged to escort her to a French convent. Near Calais he became secretly married to her; his age was 21 and hers 18. Linley brought them back to Bath and separated them. After his return, Sheridan fought two duels with Mathews, disarming his opponent the first time and being himself seriously wounded the second. On 13 April 1773, he married Miss Linley openly.

At a very early age he began writing for the theatre. On 17 January 1775, his farce-comedy, 'The Rivals,' was produced at Covent Garden. It failed and was withdrawn. In a revised form it reappeared on 28 January, and is still being played. His farce, 'Saint Patrick's Day,' was first acted on 2 May 1775. It was followed on 21 Nov. 1775, by 'The Duenna,' a comic-opera, whose great success eclipsed the popularity of Gay's 'Beggar's Opera.' In 1776 he succeeded Garrick as manager of the Theatre Royal, Drury Lane. He was careless in business, but his personal popularity atoned for his practical shortcomings. He produced a revision of Vanbrugh's 'Relapse,' called 'A Trip to Scarborough,' 24 Feb. 1777. On 8 May 1777, he presented at Drury Lane one of the greatest comedies of all time, 'The School for Scandal.' He was then only 25. A farce called 'The Critic,' in which he satirized his jealous rival, Cumberland, was performed 29 Oct 1779. This practically closed his career as a dramatist; though on 24 May 1799, he produced 'Pizarro,' a melodrama adapted from the German of Kotzebue.

His gaiety and talent made him a great favorite in society. On 12 Sept. 1780 he was elected to the Commons for Stafford, and began a remarkable parliamentary career. He developed wondrous power as an orator, and was unexcelled for brilliancy and eloquence. He was conspicuous in the impeachment of Warren Hastings. On 7 Feb. 1787 his great speech before the House of Commons, relating to the Princesses of Oude, held his auditors enthralled for five hours and a half. Hardly less effective was his speech at the arraignment of Hastings in Westminster Hall, June 1788. Throughout his public career he maintained the reputation of a pure and independent statesman.

His wife died 1792; and on 27 April 1795 he married Esther Jane Ogle. His income from Drury Lane averaged £10,000; but he often overdrew his resources to lead a dazzling social life. From 1791 to 1794 the Theatre Royal was rebuilt at ruinous expense to Sheridan; and the destruction of the new house by fire in 1809 involved him in serious financial difficulties. In 1812 he failed of re-election to Parliament; and in August 1813 he was arrested for debt. His health, weakened by social dissipations, failed rapidly; and he died

almost in want. He was buried in Westminster Abbey. (See RIVALS, THE; SCHOOL FOR SCANDAL).

Consult Oliphant, Mrs. M., *Sheridan* (1883); Moore, Thomas, *Memoirs of Richard Brinsley Sheridan* (1825); Glasgow, Alice, *Sheridan of Drury Lane* (1940); Gibbs, Lewis, *Sheridan* (1947).

CLAYTON HAMILTON,
Sometime Tutor in English, Columbia University.

SHERIDAN, Thomas, Irish clergyman, grandfather of Richard B. Sheridan (q.v.): b. County Cavan, Ireland, 1687; d. Dublin, Ireland, Sept. 10, 1738. He was educated at Trinity College, Dublin; was at one time chaplain to the lord lieutenant and later secured a living through Dean Jonathan Swift, of whom he was a close friend. He was noted for his wit and his gay carelessness, though his extravagance had reduced him to direst poverty. He wrote *The Art of Punning,* translated Persius in prose and Sophocles' *Philoctetes* in verse.

His son THOMAS, elocutionist, was father of Richard B. Sheridan, the dramatist (q.v.); b. near Dublin, Ireland, 1719; d. Margate, Kent, Aug. 14, 1788. He was educated at Trinity College, Dublin, became an actor and theater manager and afterward was successful as a lecturer and teacher of elocution. He published *Lectures on the Art of Reading* (1775); *General Dictionary of the English Language* (1780); *Life of Dean Swift* (1784).

SHERIDAN, Wyo., city and Sheridan County seat, altitude 3,738 feet. Settled in 1882, Sheridan was incorporated in 1884. It was named in honor of Gen. Philip H. Sheridan (q.v.). Three major battles with the Indians occurred in this vicinity in the 1860's. Pop. (1940) 10,529; (1950) 11,500.

SHERIF, shĕ-rēf, an Arabic title equivalent to noble. It is borne by the descendents of Mohammed, and descends both in the male and female line. Those who possess this rank are distinguished by green turbans and veils, green being the color of the Prophet. In India they are called sayid.

SHERIFF, an officer who represents the executive power of a county in the United States and is elected either by the legislature or the citizens. The requirements are controlled by statute, but usually they are that the person so elected must be over 21, a citizen of the United States and a resident of the county that he represents. The sheriff in person or by deputy executes civil and criminal process throughout the county; has charge of the prisoners, attends court and keeps the peace. His judicial authority is generally confined to ascertaining damages on writs of inquiry. He is not liable for any errors in acting in a judicial capacity—the office is almost exclusively ministerial. A sheriff has the right, when it is reasonably necessary, to lawfully summon any citizen for assistance in the execution of his duty, and one failing to obey the summons is liable to indictment; he has also the right to appoint general or special deputies in such manner as may be prescribed by his jurisdiction; but the sheriff cannot delegate his authority to appoint a deputy. The sheriff is liable for all damages caused by any wrongful act of his office, and may be criminally liable for a willful breach of his duty, if a corrupt motive is shown. A sheriff's sale is one conducted by a sheriff, or by a person deputized by him, of property held under proper authority.

SHERLOCK HOLMES, Adventures of, a collection of stories by Sir A. Conan Doyle (q.v.), in each of which Holmes figures as a scientific amateur detective of remarkable skill. He is enslaved to cocaine and in manner is brusque and eccentric; but by a method of a posteriori reasoning, applied to apparently unimportant facts of common life, he is enabled to uncover most remote and disconnected causes. The tales are full of bizarre and often gruesome details; the principal characters, Holmes and his friend Dr. Watson, appear to have been suggested to the author by Poe's *Murders in the Rue Morgue.* The first series appeared in the *Strand Magazine,* London, and in book form in 1891.

SHERMAN, shûr'măn, **Forrest Percival,** American naval officer: b. Merrimack, N. H., Oct. 30, 1896; d. Naples, Italy, July 22, 1951. An advocate of unification of the armed services, he was appointed chief of naval operations in November 1949, succeeding Louis Denfeld. Sherman was a distinguished graduate of the United States Naval Academy in 1917. He rose by promotion to the rank of vice admiral in 1946. While serving in the navy in World War I, he acquired a thorough knowledge of naval aviation. He was active in World War II, serving as chief of staff of the air force of the Pacific Fleet. After the invasion of the Republic of Korea by North Korean Communist forces on June 25, 1950, Sherman expanded the Navy's Far Eastern command to about 150 ships within two months, including one heavy and one escort task force.

SHERMAN, Frank Dempster, American poet: b. Peekskill, N. Y., May 6, 1860; d. New York, Sept. 19, 1916. He was graduated from Columbia University in 1884 and subsequently studied at Harvard. For many years he was a professor of graphics at Columbia. He published *Madrigals and Catches* (1887); *Lyrics for a Lute* (1890); *Little Folk Lyrics* (1892); *Lyrics of Joy* (1904); *A Southern Flight* (with Clinton Scollard, 1905); also several volumes of Sherman family history.

SHERMAN, Henry Clapp, American chemist: b. Ash Grove, Va., Oct. 16, 1875. He was graduated at Maryland Agricultural College in 1893 and took his Ph.D. at Columbia University in 1897. After 1897 he was connected with the department of chemistry at Columbia University. He has been research associate of Carnegie Institution since 1912. He is the author of *Chemistry of Food and Nutrition* (1911, 7th rev. ed. 1946); *Food Products* (1914, rev. 1933); *The Vitamins* (1922, 2d ed. 1943); *Foods: Their Values and Management* (1946).

SHERMAN, James Schoolcraft, American politician and vice president of the United States: b. Utica, N. Y., Oct. 24, 1855; d. Oct. 30, 1912. He was graduated at Hamilton College in 1878, was admitted to the bar in 1879, and engaged in practice in Utica. He was mayor of Utica in 1884–1885 and served in Congress in 1887–1891 and 1893–1909. He was for many years promi-

nent in the affairs of the Republican party, was chairman of the Republican State Convention in 1895, 1900 and 1908, and in 1906 he was chairman of the Republican National Congressional Committee. He was elected vice-president of the United States in 1908, but died before the expiration of his term of office. He was renominated for the vice-presidency in 1912, but died a few days preceding the election. He was a trustee of Hamilton College.

SHERMAN, John, American statesman: b. Lancaster, Ohio, 10 May 1823; d. Washington, D. C., 22 Oct. 1900. He was the eighth child in a family of 11, being the junior by three years of his brother Gen. William Tecumseh Sherman (q.v.). He attended about two years at Homer Academy, Lancaster, Pa., between 1835–37. After having secured an irregular and not very complete general education, he studied law and was admitted to the bar at 21. In 1848 he was a delegate to the National Whig convention at Philadelphia. In the same year he married and established a mill for lumber work, which he carried on together with his law practice. He was president of the first Republican convention in Ohio, held at Columbus, 13 July 1855, which nominated Salmon P. Chase for governor. In 1855 he was elected a member of the 34th Congress. He took a prominent part in the proceedings of the House; was on the Committee of Inquiry sent to Kansas, and wrote the report of its investigations. He was prominently identified with the support of all measures for the prosecution of the Civil War; defended the protective tariff, and the refunding of the National debt. He was a member of the committee that visited Louisiana to supervise the counting of the returns of that State, and a member of the Electoral Commission. In Congress, Mr. Sherman quickly demonstrated his exceptional power as a master of finance. He watched carefully the appropriation bills, speedily extended the credit of the government, and provided for its future support. When Salmon P. Chase resigned the United States senatorship from Ohio to enter the Cabinet of President Lincoln, as Secretary of the Treasury, Mr. Sherman was elected his successor and took his seat 4 March 1861. In 1881 he was re-elected to the Senate, where he remained until 1897, when he was appointed Secretary of State by President McKinley. He resigned that office, however, in 1898, on account of failing health. He was a candidate for the Presidential nominations in 1884 and 1888. Among his publications are 'Selected Speeches and Reports on Finance and Taxation' (1879); and 'Recollections of Forty Years in the House, Senate, and Cabinet' (1893). From 1860 to 1900, there was scarcely a great financial measure with which the name of John Sherman was not connected. Among these were the making of United States treasury notes legal tender, the enacting of the national banking bill, the refunding act of 1870, and the resumption of specie payments. The detailed record of measures by which the legal tender notes of the government reached par, and by which specie resumption became an accomplished fact at the time fixed for it, exhibits the man under whose leadership this was done as a financier of the highest order. General Sherman was Secretary of the Treasury in Hayes' administration from March 1877 to March 1881. Consult 'The Sherman Letters: Correspondence between General and Senator Sherman from 1837 to 1891' (ed. by Rachel S. Thorndike, New York 1894); Burton, **T. E.,** 'John Sherman' (New York 1906).

SHERMAN, Roger, American legislator: b. Newton, Mass., 19 April 1721; d. New Haven, Conn., 23 July 1793. He was apprenticed to a shoemaker when a child, but in 1743 he removed to New Milford, Conn., where he was engaged with his brother in keeping a small store. He studied law, politics and mathematics without a teacher, was appointed surveyor for his county in 1745 and for several years made the astronomical observations for an almanac published in New York. In 1754 he was admitted to the bar, served for several terms in the provincial assembly, and in 1761 removed to New Haven, Conn. He became judge of the Court of Common Pleas there in 1765 and served in that position and as judge of the Superior Court for 23 years. He was assistant governor in 1766–85, treasurer of Yale College in 1766–76, and a member of Congress from 1774–91, when he was elected senator in which capacity he served the remainder of his life. He was one of the committee of five to draft the Declaration of Independence which he afterward signed, was an active member of various war and ordinance committees, served on the treasury board and in 1777 was one of the framers of the original Articles of Confederation. He assisted in the codification of the laws of Connecticut, was a delegate to the Federal Constitutional Convention in 1787, where he played a prominent part, and from 1784 until his death was mayor of New Haven.

SHERMAN, Stuart Pratt, American educator, critic and editor: b. Anita, Ia., 1 Oct. 1881; d. near Manistee, Mich, 21 Aug. 1926. He was graduated from Williams College in 1903, and took post-graduate studies at Harvard. He was instructor in English at Northwestern University in 1906–07, and from 1907–24 was on the faculty of the University of Illinois, from 1911 as head of the Department of English. He left this chair in that year to become editor of 'Books,' the literary supplement of the *New York Herald Tribune*. He wrote much on literary subjects, and was co-author of the 'Cambridge History of American Literature.' Other books include 'Americans,' 'The Genius of America,' 'Critical Woodcuts,' 'Main Streams' (posthumous, 1927).

SHERMAN, William Tecumseh, American soldier: b. Lancaster, Ohio, 8 Feb. 1820; d. New York, 14 Feb. 1891; son of Judge Charles R. Sherman. His father died when he was about nine years old, and he was brought up in the family of Hon. Thomas Ewing, who procured for him an appointment as cadet at the United States Military Academy, West Point. He is described as having been at the time a tall, slim, loose-jointed lad, with red hair, fair, burned skin and piercing black eyes. In July 1840 he was graduated from the academy and appointed second lieutenant in the Third artillery, and first lieutenant Nov. 1841. He served in Florida until 1842, and was afterward in garrison at Fort Moultrie, S. C.

At the first rumor of war with Mexico he showed great impatience to be sent to Texas, but the War Department, instead, ordered him to California. The voyage appears to have made him strongly in favor of an interoceanic canal. He served in California as acting assistant adjutant-general of the department until February 1849, when he was transferred to similar duty on the staff of Gen. Persifor F. Smith who commanded the division of the Pacific. Having been ordered to New York as bearer of dispatches, he was married in January 1850 to Ellen Boyle, daughter of his foster-father, Hon. Thomas Ewing, then Secretary of the Interior.

In September 1850 Sherman was transferred to the commissary department with the rank of captain and stationed at Saint Louis and New Orleans. Shortly after his arrival at New Orleans he received notice of his appointment as partner in the banking firm of Lucas and Turner, a branch of Lucas and Simonds, of Saint Louis. Feeling that he could do better in business than in the army, he obtained a six months' leave of absence and started for California to represent the house. When the leave of absence expired he resigned from the army. Sherman at this time saw the danger of the slavery issue. "Unless people both North and South," he wrote in August 1856, "learn more moderation we'll see sights in the way of civil war."

Sherman removed to New York in 1857, and to Leavenworth, Kan., in 1858, where he practised law until July 1859, when he was elected superintendent of the proposed military academy in Louisiana. The institution was opened 1 Jan. 1860, as the Louisiana State Seminary of Learning and Military Academy, and Sherman remained its superintendent until 18 Jan. 1861, when he wrote to the governor asking to be relieved the moment the State determined to secede. His request having been granted, he went to Saint Louis in February 1861 and was for a short time president of a Saint Louis railroad company. While holding this place he was deeply interested in the approaching struggle between North and South, making valuable suggestions, some of which were shown by his brother, John Sherman, then in Congress, to Secretary of War Cameron. "On the necessity of maintaining a government, and that government the old constitutional one," he declared, "I have never wavered, but I do recoil from a war when the negro is the only question."

In May 1861 Sherman was appointed colonel of the 13th regular infantry, and 30 June he assumed command of a brigade of McDowell's army. He took an honorable part in the first battle of Bull Run; on 3 August received his commission as brigadier-general of volunteers, dating from 17 May, and 24 August was ordered to duty in the Department of the Cumberland, under Gen. Robert Anderson, whom he succeeded in command of the department 8 October. On the 26th of the same month he wrote that "to accomplish the only purpose for which Kentucky can be used there should be a force here of 200,000 men." In November Sherman, who was severely criticized by many for his assertions as to the number of men needed for the war in his section, was relieved of his command and sent to Missouri. After a short leave at home he was employed for a time as commander of the camp of instruction at Benton Barracks, near Saint Louis. In February 1862 he was transferred to Paducah, Ky., where he organized the division which he subsequently commanded at Shiloh. In this hard-fought, two-days' conflict Sherman was severely wounded, and Grant declared that "tc his individual efforts I am indebted for the success of that battle." Sherman was commissioned major-general of volunteers, 1 May, and in the same month compelled the Confederates to evacuate Corinth, which was followed, in July, by the occupation of Memphis. His campaign against Vicksburg proved unfortunate. He was defeated and driven back to Chickasaw Bayou, but afterward rendered effective aid to Grant in the operations which resulted in the surrender of Vicksburg.

Sherman was made a brigadier-general of the regular army in July 1863. After the fall of Vicksburg and Port Hudson the Western armies lay comparatively idle for a time, and early in the autumn Sherman was occupied in rebuilding the Memphis and Charleston railroad to the East, that the armies might draw supplies by that route. While engaged on this work he was ordered to cross the Tennessee and march eastward. The battle of Chattanooga, in which he distinguished himself, followed, and he was next sent to the relief of Burnside, besieged by the Confederates in Knoxville. Sherman forced Longstreet to raise the siege 5 Dec. 1863. After a few weeks in winter quarters in northern Alabama, Sherman in January 1864 made a raid across the State of Mississippi from Jackson to Meridian and back again, doing a vast amount of damage to railways, Confederate property and the country at large. Grant being invited to take unhampered command of the military forces of the United States and to repeat, if possible, in the East, the successes which had attended his career in the West, assigned Sherman to the command of the Military Division of the Mississippi, including the Departments of the Ohio, the Tennessee, the Cumberland, and the Arkansas, with temporary headquarters at Nashville, and with orders to move on Atlanta. With an army of about 100,000 men Sherman invaded Georgia. He was opposed by Gen. Joseph E. Johnston, with about 45,000 Confederates in excellent spirit and discipline, but poorly provided with munitions of war, as compared with the Union forces. Johnston engaged Sherman's army at Dalton, Resaca, Cassville, Dallas and Kenesaw Mountain. At the last-named place, 27 June, the Confederates, owing to the shortness of artillery ammunition, reserved their cannon for the final charge of the Union troops, receiving them with a destructive fire which won the day for the South.

Sherman's progress, however, could not be stayed, and the Richmond government, believing that Johnston was not doing all that could be done with the men at his command, relieved him and put Hood in his place. Sharp battles followed in the vicinity of Atlanta, and at length Hood was compelled to evacuate the city during the night of 1 September. Sherman issued an order that all the inhabitants should leave Atlanta, going North or South as they

saw fit, and offered transportation to that end. Mayor Calhoun and other citizens appealed in vain to have the order recalled. "You cannot qualify war in harsher terms than I will," answered Sherman, "war is cruelty and you cannot refine it." The order was carried out and approved by the authorities at Washington. Sherman gave as his reasons to his military superiors that he wanted all the houses for military and storage purposes, and did not wish to be burdened with the care of the inhabitants.

Sherman became convinced, after a series of indecisive operations against Hood, that the aim of the latter was to draw him out of Georgia. He determined on marching to the sea, cutting a swath of devastation through the heart of the Confederacy and destroying, as far as possible, the sources of Confederate supplies. Grant fully approved of the plan, and Sherman, after burning Atlanta, breaking up the railway, and sending a part of his army to reinforce Thomas at Nashville, started with about 70,000 men on his memorable march. He ordered his troops to forage liberally on the country and although foraging was supposed to be done by regular details only, it was, in fact, carried on practically without restriction, and the devastation along the line of march was most complete. The Confederates had virtually no force to oppose Sherman's advance and when the governors of Alabama, South Carolina and Georgia were appealed to from Richmond, the first mentioned replied that none but cripples, women and children, and very old men were left in the state. Sherman entered Savannah December 23, having lost on his march from Atlanta, 103 killed, 428 wounded and 278 missing. Congress, Jan. 10, 1865, tendered the thanks of the people of the United States to Sherman and his command. He moved northward February 1 and occupied Columbia February 17, the place being destroyed by a conflagration for which Sherman always claimed that he was not responsible.

General Johnston was recalled to command by the chiefs of the sinking Confederacy, and after several desperate encounters, Sherman and Johnston met at Durham Station, N. C., April 18. The terms agreed upon were most liberal to the Confederates allowing them to deposit their arms at their state capitals, and providing for the recognition of their state governments. The terms were made subject to the approval of superior authority, and a suspension of hostilities was agreed upon to obtain that consent, 48 hours' notice to be given by either side before resuming hostilities. Lincoln had been murdered; there was a vindictive feeling toward the South at Washington, and Johnson and his cabinet wholly disapproved Sherman's arrangement, and ordered Grant to take charge of Sherman's command. Grant, always generous in his recognition of Sherman's merits, went to Raleigh, as directed, but left to Sherman the honor of receiving Johnston's surrender on the same terms as those granted to Lee. Sherman keenly felt what he regarded as unjust treatment on this occasion by Secretary of War Stanton and declined publicly to take Stanton's proffered hand at the great army review in Washington May 24, 1865.

Sherman was appointed to command the military division of the Mississippi June 27, 1865; promoted to lieutenant-general July 25, 1866, and assigned in August to the military division of the Missouri. On the accession of Grant to the presidency, Sherman succeeded to the command of the army as general. About this time he wrote, "I do think some political power might be given to the young men who served in the rebel army, for they are a better class than the adventurers who have gone South purely for office." Sherman retired Feb. 8, 1884, taking, to the last, an active interest in public affairs. A splendid equestrian statue, by Saint-Gaudens, presenting Sherman in characteristic attitude as when he rode at the head of his army, was unveiled at the southeastern entrance of Central Park, New York, in 1903, and another handsome equestrian statue of the great general was dedicated in Washington the same year, President Roosevelt taking part in the ceremonies. The Washington statue stands on the spot where Sherman reviewed the grand march of the Union army in 1865.

Consult *Memoirs* (autobiography, New York 1875); Liddell-Hart, B. H., *Sherman—Soldier, Realist, American* (New York 1929); Burne, A. H., *Lee, Grant, Sherman* (New York 1939); Lewis, L., *Sherman, Fighting Prophet* (New York 1932, new ed., 1939).

SHERMAN, city, Texas, and Grayson County seat, altitude 720 feet; on the Frisco Lines; the Missouri-Kansas-Texas of Texas; the St. Louis Southwestern; the Southern Pacific, and the Texas Electric railroads; on bus and motor-freight lines, with state and federal highways; by rail, 64m. N. of Dallas. Sherman is 14m. S. of the Red River which forms a portion of the boundary between Texas and Oklahoma. In the northern part of the county the soil is a sandy loam, producing large quantities of fruit and vegetables; a large acreage is planted in onions. The southern section of the county, with its black earth, grows cotton and grain. Sherman, located centrally in the county, is a trade center and a distributing point for farm crops and livestock, as well as a manufacturing and industrial center. Cotton is a basic factor in the city's industrial structure; its processing and use in manufacture support cotton gins, cottonseed mills, and textile mills. A large industry is carried on in railroad and machine shops and iron works. Industrial products include harnesses, mattresses, oleomargarine shortening, corrugated boxes, and condensed milk. Sherman has 28 churches of various denominations and two hospitals. The school system includes five elementary public schools, one parochial school, and a public high school. The city is liberally supplied with parks, playgrounds, and recreational centers. It is the seat of Austin College, founded at Huntsville in 1849 and removed to its present location in 1876. Two ex-presidents of the Republic of Texas, Sam Houston and Anson Jones (qq.v.), were members of the original board of trustees. Sherman also has a Carnegie library, and a library at the college. Among the social, civic, and service clubs the musical organizations are prominent. Fourteen miles north of Sherman on the Red River is the $51,000,000 hydroelectric government project. In 1857 John Butterfield, proprietor of a transportation service between St. Louis and San Francisco, routed his stages through Sherman, and long-distance transportation of passengers and goods contributed to the growth of the settlement. Incorporated as a town in 1858, Sherman was chartered as a city in 1895. The city's name honors Gen. Sidney Sherman, commander of cavalry at the battle of San Jacinto.

Sherman has commission government with a

city manager. The first courthouse erected at what is now the city of Sherman was a log structure, which is said to have been torn down in 1857 to settle a bet as to whether or not a certain duck had her nest under the building. Pop. (1950) 20,150.

SHERMAN ACT, an act of the United States Congress, approved July 2, 1890. The passage of the act gave legislative expression to the American faith in an economic system predicated upon the theory of free competition. It is directed to the protection of interstate and foreign commerce from unreasonable restraints, monopolization and attempts to monopolize, and from combinations and conspiracies to achieve these ends. Violations are made misdemeanors punishable by a fine or imprisonment not exceeding one year, or both. Persons injured by activities which are illegal under the act may sue for treble damages and the courts are empowered to enjoin violations and dissolve illegal combinations and monopolies. The act defines the illegal activities in general terms. However, supplementary and amendatory statutes and the numerous judicial decisions interpreting the act have defined with particularity many of the specific business practices and activities condemned. The Sherman Act, Clayton Act, Federal Trade Commission Act and related statutes constitute a body of laws known as the Federal Antitrust Laws. See ANTITRUST LAWS; TRUSTS, THE GROWTH AND CONTROL OF.

An act of Congress approved July 14, 1890, relating to the purchase of silver by the United States Treasury, is also sometimes referred to as the Sherman Act.

SHERRIFF, shĕr'ĭf, **Robert Cedric,** British author: b. Kingston-on-Thames, June 6, 1896. He started his business career as an insurance clerk, with a great interest in sports. He served with the British Army during World War I and was wounded at Ypres. Returning to his insurance career in 1918, he began writing amateur plays for the Kingston Rowing Club. *Journey's End* (q.v.), based on his war experiences, was one of these. Finally produced professionally in 1929, this play became an international success. He wrote several other plays and novels (*The Hopkins Manuscript,* 1939), none of which became as famous.

SHERRILL, Charles Hitchcock, American lawyer: b. Washington, D.C., April 13, 1867; d. Paris, France, June 25, 1936. He was educated at Yale, and was admitted to the bar in 1891. In 1909 he was appointed minister to Argentina, and in 1911 retired from the diplomatic service on account of ill health after having declined appointment as ambassador to Japan. He published *Stained Glass Tours in France* (1908); *Stained Glass Tours in England* (1909); *Stained Glass Tours in Italy* (1913); *Prime Ministers and Presidents* (1922); *A Year's Embassy to Mustafa Kemal* (1934).

SHERRINGTON, shĕr'ĭng-tŭn, SIR **Charles Scott,** English neurophysicist: b. London, Nov. 27, 1857; d. Eastbourne, England, March 4, 1952. Co-winner of the Nobel Prize for physiology and medicine in 1932, he was a specialist in fields dealing with the brain and the nervous system.

Sir Charles' research on the nervous system is considered by some authorities as a basis for understanding the physiology of the brain and the nerves, and thereby expanding the field of brain surgery. His findings demonstrating the effect of reflex actions in facilitating the nervous system to function as a unit culminated in his publication of *The Integrative Action of the Nervous System* (1906; rev. eds. 1929 and 1948). Knighted in 1922, he received the Order of Merit, Britain's highest award for achievement, in 1924, and in 1932 he shared the Nobel Prize with Edgar D. Adrian for their joint discoveries concerning the functions of neurons.

After his retirement from the Waynflete chair of physiology at Oxford in 1936, Sir Charles turned to philosophic writings, his *Man on His Nature* (1940; 4th ed. 1946) arousing wide discussion.

SHERRY, shĕr'ĭ, a white Spanish wine which is grown in a small region between the mouths of the Guadalquivir and Guadalete, and is named from Jerez, the center of the sherry industry. The grapes, both red and white, are fully matured, and natural sherry is somewhat harsh. Condensed wine liqueur, sugar, and spirit are usually added, and the resultant wines are blended to the required taste. The two chief varieties are the pale, or dry, and the brown, or sweet. Typical of the former is Manzanilla; of the latter Amontillado. Other brands are called Fino, Oloroso, and Vino de Pasto. Sherry improves by keeping. It is a delicate, full-bodied wine of rich flavor. See WINE AND WINE MAKING.

SHERWOOD, shûr'wo͝od, **Robert Emmet,** American playwright: b. New Rochelle, N. Y., April 4, 1896; d. New York, Nov. 14, 1955. He was educated at Milton Academy and Harvard University, where his schooling was interrupted by World War I. He joined the 42d Battalion of the Canadian Black Watch and was wounded while participating in major battles of France. Harvard conferred an A.B. degree on him in 1918. His career in journalism began at *Vanity Fair* magazine, where he was dramatic critic from 1919 to 1920. His first play *The Road to Rome* (1927) was an immediate success. An historical play, with Hannibal as a main character, it showed Sherwood's great interest in peace and the futility of war which have provided the themes for the majority of his plays. He followed it with *The Queen's Husband* (1928), *Waterloo Bridge* (1929), *This is New York* (1930), and *Acropolis* (1933).

His later plays have been tremendously successful. He was awarded a Pulitzer Prize for *Idiot's Delight* (1936), *Abe Lincoln of Illinois* (1938), and *There Shall Be No Night* (1940). His two other plays of the period were *The Petrified Forest* (1934) and *The Rugged Path* (1945). He wrote the musical comedy *Miss Liberty* (1949) in collaboration with Moss Hart and Irving Berlin.

During World War II, Sherwood served overseas with the United States Office of War Information and was also a literary adviser to President Franklin D. Roosevelt in preparation of his speeches. His biography *Roosevelt and Hopkins* (1948) was awarded the 1949 Pulitzer Prize in biography and the 1949 Bancroft Prize for historical writing.

SHERWOOD FOREST, an ancient forest, England, in the west of Nottinghamshire, in a

hilly district between Nottingham and Worksop. The tract covered about 200 square miles and was formerly a royal forest, famous as the scene of the exploits of Robin Hood and his merry men, many legends of whom are yet to be heard in the surrounding country. Only a small portion of the forest, near Rotterham, still remains. The rest of the country it once covered is now occupied by country seats and private parks, and is for the most part bare of trees. The town of Mansfield and several villages are within the ancient bounds, which were about 25 miles from north to south and six to eight miles from east to west.

SHETLAND, shĕt'lănd or **ZETLAND,** zĕt'lănd, group of islands off the northern coast of Scotland. The Orkneys lie between them and the mainland. They number about 30, and in addition there are some 70 uninhabited islets. The area is 551 square miles. The largest island is Mainland.

The chief industries are the breeding of cattle and sheep, and fishing. Oats, barley, and potatoes are grown. Shetland ponies are bred, and there are some domestic industries. Lerwick is the capital. The islands are thought to have been the Ultima Thule of classical writers. They were part of Norway from 875 to 1468, when they were ceded to Scotland. Pop. (1951) 19,343.

SHEWBREAD, shō'brĕd, the 12 unleavened loaves placed upon a table in the outer department of the Jewish sanctuary. The number 12 represented the 12 tribes. The loaves were placed in two piles, one above another, and were changed every Sabbath day by the priests. The removed bread became the property of the priests, who alone had a right to eat of it, and only in the holy place. In cases of emergency, however, they incurred no blame by giving it to persons who were in a state of ceremonial purity, as in the instance of David and his men (I Samuel 21:4-6; Matthew 12:4).

SHIBBOLETH, shĭb'ô-lĕth, a word which on a certain occasion served as a test to distinguish Ephraimites from Gibeonites. Jephtha's men, Gibeonites, held the ford of Jordan, with orders to suffer no Ephraimite to cross over. When challenged with the question "Art thou an Ephraimite?" the man of Ephraim would answer "Nay." "Say now Shibboleth"; and the other pronounced it "Sibboleth," "for he could not frame to pronounce it right." In the Septuagint version, which is followed by the Latin Vulgate, the "point" of the question is completely lost: "Art thou not an Ephraimite?" and they said "Nay." And they said to him, "Then say *stachys,*" that is, "say ear" (of corn), which is the etymological meaning of the Hebrew word shibboleth: "and he framed not to speak so."

SHIBUSAWA, shê-bōō-sä-wä, Viscount **Ei-ichi,** Japanese banker: b. Saitama prefecture, Feb. 2, 1840; d. Tokyo, Nov. 10, 1931. He entered government service at Tokyo under the Tokugawa shogunate when still a youth. Upon the establishment of the imperial government in 1869 he was appointed to a high office in the treasury, but resigned in 1873 and held no other government position, despite frequent offers. He founded the first national bank, known as the First Bank, in 1873, and became a power in the Japanese financial world. In 1905 illness forced his retirement from business. He returned to active life for a short time after the Russo-Japanese War. He visited the United States in 1902, 1909, and 1915.

SHIDEHARA, shê-dĕ-hä-rä, Baron **Kijuro,** Japanese diplomat: b. Osaka, Japan, Aug. 11, 1872; d. Tokyo, March 10, 1951. Active in the Japanese diplomatic service since 1895, Shidehara was chosen by the Japanese emperor in 1945 to act as prime minister until a representative Diet could be elected. He was the speaker of the Japanese House of Representatives up to the time of his death.

He entered the Japanese diplomatic service on his graduation from the Law College of Tokyo Imperial College (1895), and in 1899 served at the Japanese consulate in London. In succession he was secretary at the head office in Japan (1911–1912), counselor to the Japanese embassy in Washington (1912–1913), counselor to the embassy in London (1913–1914), and minister to the Netherlands (1914–1915). From 1915 to 1919 he served as vice minister of foreign affairs in the Japanese Cabinet, and in the latter year was appointed ambassador to the United States, serving until 1922. During this time he was a delegate to the Washington Naval Disarmament Conference (1922). From 1924 to 1931 he was minister of foreign affairs in six of the seven Japanese cabinets, serving in 1930 as acting prime minister during the illness of Yuko Hamaguchi. He retired in 1931, yielding to a more militaristic government.

Recalled from his retirement in 1945 to serve temporarily as prime minister until national elections could be held, he resigned this position on April 22, 1946, but remained acting premier until Shigeru Yoshida was installed as premier on May 22. Shidehara was named vice premier in the Yoshida Cabinet.

SHIELD, shēld, **William,** English composer: b. Swalwall, Durham, March 5, 1748; d. London, Jan. 25, 1829. His earliest sustained work was a comic opera, *The Flitch of Bacon* (1778), and having been appointed composer to Covent Garden (1778–1797), he produced *Rosina* (1783); *The Poor Soldier* (1784); *The Woodman* (1792); *Two Faces Under a Hood* (1807). But he is best known by his songs, among which are *The Heaving of the Lead; The Arethusa; The Thorn; O Bring Me Wine; The Ploughboy;* and *The Wolf.*

The tune of *Auld Lang Syne,* as now sung, was introduced into his *Rosina;* the authorship of *Coming through the Rye* has also been claimed for Shield.

SHIELDS, shēldz, **Charles Woodruff,** American educator: b. New Albany, Ind., April 4, 1825; d. Newport, R. I., Aug. 26, 1904. He was graduated from Princeton in 1844, from the Theological Seminary there in 1847, was ordained in the Presbyterian ministry and served in charge of pastorates at Hempstead, L. I., in 1849–1850, and in Philadelphia, Pa., in 1860–1865. He later occupied the chair of harmony of science and revealed religion at Princeton. His publications include *The Presbyterian Book of Common Prayer according to the Revision of the Westminster Divines* (1864); *Religion and Science in Relation to Philosophy* (1875); *The Order of the Sciences* (1882); *The*

United Church of the United States' (1896); 'The Scientific Evidences of Revealed Religion' (1900), etc.

SHIELDS, James, American military officer: b. Dungannon, Ireland, 1810; d. Ottumwa, Iowa, 1 June 1879. He came to the United States in 1826 and entering the army subsequently served through the Mexican War and for bravery in the battles of Cerro Gordo and Chapultepec was brevetted major-general. He was United States senator from Illinois in 1849 and from Minnesota in 1857. During the Civil War he especially distinguished himself by defeating «Stonewall» Jackson at Winchester, 23 March 1862. He was defeated at Port Republic 9 June 1862 and resigned his commission in 1863.

SHIELDS, John Knight, American lawyer, jurist and senator: b. Clinchdale, Tenn., 15 Aug. 1858. He was privately educated and was admitted to the bar in 1879, practising thereafter at Knoxville, Tenn. He became associate justice of the Supreme Court of Tennessee in 1902, and was chief justice of that court in 1910–13. He was elected to the United States Senate in 1913; re-elected in 1918, but was defeated for renomination in 1924. D. 30 Sept. 1934.

SHIELDS, England, the urban aggregation of North and South Shields, two separate municipalities and important seaports in Northumberland and Durham respectively, on opposite banks of the Tyne, near its mouth in the North Sea. The port of Shields, formed by an expansion of the river into a wide bay, has been greatly improved and deepened by dredging and the construction of piers, and accommodates vessels of any size at their quays. There is a very extensive trade, particularly in coal, of which more than 2,500,000 tons were shipped a year before the war.

North Shields, on the north bank of the Tyne, forms part of the municipality and parliamentary borough of Tynemouth (q.v.) together with three small townships. It extends about one mile along the river, and consists of an old and a modern portion, the former with narrow streets and lanes, and the latter with spacious streets and squares. The township extends up the river to Willington, and includes Northumberland Dock and Albert Edward Dock. The chief industrial establishments are shipbuilding yards, saltworks, iron foundries, marine-engine works, and electrical works. Fishing is largely carried on, and much fish is sent to many parts of England. Pop. 63,788.

South Shields, opposite North Shields, communicates with the latter by steam-ferries. The Saint Hilda coal-mine in the town was opened in 1810. The old part of the town consists of long narrow streets running parallel to the river; but the modern part, immediately behind, occupies a higher site and possesses many handsome buildings. The public institutions include a town hall, police buildings (1893), a custom-house, free library and museum, infirmary, fever hospital, public baths and washhouses; nautical college, national and other schools and several benevolent endowments. The harbor is lined with ship and boat yards and factories. The chief industries are coal-mining and coal shipments, shipbuilding and ship-repairing, marine-engine and boiler-making, and the manufacture of glass, earthenware, chain-cables, rope and anchors. Coal is shipped principally at the Tyre docks, area, 50 acres, belonging to the North-Eastern Railway Company. The first lifeboat was built in South Shields and put to sea 30 Jan. 1790. A stone pier a mile long has been constructed at the mouth of the harbor. Pop. 119,600.

SHIELDS. Weapons of defense held before the bearer to protect against blows or projectiles. The shield has been probably universally used by all nations and tribes from that early period when the human being needed an outdoor defense. The early Greeks had their circular shield (*aspis*) of leather or felt, and the *sakos* or oval shield. The ancient descriptions show how these shields were beautified, as the metal one of Achilles made by Hephaistos (according to Homer) with its embossed scenes, that of Heracles in Hesiod's description. Often they had individual badges painted on them (forerunners of the knights' heraldic shields), a custom borrowed from the Persians. The Romans, Diodorus says, at first used square shields, then the *aspis,* and later the large circular iron *clypeus* and the four cornered four-foot-long *scutum,* of wood. Later the light circular *parma* of leather was used by the *velites.* Old Roman bas-reliefs show us also hexagonal shields. The shields of the Gauls (*pavoises*) were so great they crossed rivers in them. The shield of the crusaders was pointed (*heater*-shape). The English buckler and the Scotch targe are old subjects for painters and poets. The shields of the knights or of heraldry are very varied in form changing with the different periods and methods of combat. The «heater» shape was in use in the 12th, 13th and 14th centuries; in the 14th century the sides often ran parallel, the top was still a straight line but the bottom was almost a half round. Then the tilting shields began to appear and indentations were made in the side (termed «bouches») to allow for the passage of the lance, these were very much smaller than the triangular shield of the warrior on foot. But the actual shield of the knight soon passed into the art of heraldry, to be known generally as a *scutcheon,* and assumed fantastic shapes that were never seen in combats; even the distaff (woman) side of the «house» receiving a shield of «lozenge» (diamond) form. A very natural evolution from the decorative shield of heraldry was that to the shield as an accessory in ornament, when it took the place of the *cartouche.* In the decorative arts the shields are endless in form, their decorative curling and curving straps being derived from the metalworkers' beaten cartouches worked up to ornament the gates and doors of the different periods. Perhaps the most extravagantly decorative shield forms are those of the Renaissance, baroque, and rococo periods. Shields have been much utilized as a motif by artists in their decorative «trophy» groupings, and to the present day there is no more favored device in every branch of Art, including architecture, than the shield form.

Clement W. Coumbe,
Technical Art Expert.

SHIITES, shē'īts, or **SHIAH,** that sect or party of Mohammedans who assert the rights of Ali (q.v.), the son-in-law of the Prophet, and his descendants to be the true line of

Caliphs, as opposed to the Sunni or Sunnites (q.v.), who uphold the succession of the Caliphs Abu Bekr. The divergence — not unmixed with animosity — that exists between the two sects is similar to that of Protestants and Roman Catholics of former times, and constitutes even to-day the weakest point in the armor of Islam. The Persians and most of the Moslems in India are Shiites, while the Turks and many Arabs adhere mainly to the Sunni faction. The Persians adopted the Shiah doctrines in 1500, since when they have been the national law and religion of that country. Yet neither creed is pure and unadulterated, for each is again subdivided into smaller schisms. (See HASAN and HUSAIN; MOHAMMED; OMMIADS). Consult Muir, W., 'The Life of Mohammed' and 'The Caliphate' (London).

SHIKARPUR, shĭk-är-poor', India, (1) a former district in Sind, Bombay, comprising the four subdivisions of Rohri, Sukkur, Larkana and Mehar. The two first now form the Sukkur district and the other two (since 1901) the district of Larkana. (2) A subdivision of the Sukkur district (see above), composed of the Shikarpur, Naushahro Abro and Sukkur *talukas* or departments. (3) Shikarpur Taluka of Sukkur district, Sind, Bombay, has an area of 492 square miles and a population of about 110,000. It contains one town, Shikarpur (see below) and 88 villages. (4) Town, headquarters of the *taluka* of the same name in Sukkur district, stands in a tract of low-lying country which is annually flooded by canals from the Indus (18 miles west). The soil is rich, producing grain and fruit. Its buildings have been much improved in recent years. There is a famous bazaar with a flourishing trade, owing to the town's position on one of the great routes from Sind to Khorassan *via* the Bolan Pass. There are 17 government schools — one high school, 12 for boys and four for girls (two each for Hindus and Mohammedans), and several private schools (one English). The principal manufactures are carpets and coarse cottons; the more important exports are indigo, metals, henna, spices, groceries, opium, horsecloths, dry grains and silks. Since the Municipal Act of 1855 great sanitary improvements have been effected. Pop. 55,503, about one-third Mohammedans and the rest Hindus. (5) Shikarpur Taluk, the northern department of Shimogo district, Mysore; area, 429 square miles; pop. about 70,000. The jungle harbors tigers, leopards and other wild animals. The headquarters is also named (6) Shikarpur Town; pop. 5,568. (7) A town in the district of Bulandshahr, United Provinces; pop. about 13,000. The American Methodists maintain a branch mission here.

SHILKA, shĭl'kä, a river of Asia, in eastern Siberia, rises among the Yablonoi Mountains and is one of the two rivers (the other is the Argun) which by their union form the Amur, into which it empties at a point beyond Ust Strelka. The Shilka flows from Mount Kentai in the Khan-ula range (Chinese Mongolia) mostly through Russian territory, before reaching which it is known as the Onon. It is about 320 miles long and navigable about one-half of the year. In winter its frozen bed is utilized as a highway. Sretensk is an important station on the river for vessels going to Khabarovsk. It is a terminus of the Trans-Siberian Railway and the starting point of Russian expeditions to the Lower Amur.

SHILLABER, shĭl'ą-bėr, **Benjamin Penhallow**, «MRS. PARTINGTON,» American humorist: b. Portsmouth, N. H., 12 July 1814; d. Chelsea, Mass., 25 Nov. 1890. After a brief secondary schooling and training in a local printer's office, he went to Boston, where he followed his trade in several newspaper offices, with the interruption of a year's visit to British Guiana. Then he began journalistic work. Achieving from the first (1847) a great success with his 'Sayings of Mrs. Partington,' whose homely wisdom is closely allied to that of the Widow Bedott. In Boston he was successively an editor of the *Post* and editor-in-chief of the *Carpet-Bag*, a humorous publication of short-lived fame, and of the *Saturday Evening Gazette* (1856–66). Shillaber's work was not, as one critic has phrased it, «trained to move in literary circles,» but in that it was similar to most American humor of its period. Among the titles of his books are 'Rhymes with Reason and without' (1852); 'Life and Sayings of Mrs. Partington' (1853); 'Mrs. Partington's Knitting Work' (1857); 'Partingtonian Patchwork' (1872); 'Lines in Pleasant Places' (1875); 'Ike and his friend' (1879); and 'Cruises with Captain Bob' (1880); 'Wideswathe' (1884).

SHILLELAGH, shĭ-lā'lä, the cudgel of blackthorn or oak carried by the conventional Irishman, with which he is supposed to delight to play on the heads of his friends on occasion. The name is borrowed from the once famous oak forest of Shillelagh in the southwest corner of County Wicklow, 17 miles southwest of Aughrim. There are about 12 ways of spelling this word.

SHILLING, the name of an English silver coin and money of account since the Norman Conquest, of the value of 12 pence, or the 20th part of a sovereign or pound sterling; and equivalent in the United States to about 24⅓ cents. In the United States, a denomination of money formerly in use, differing in value relatively to the dollar in different States, but below that of the English shilling with a corresponding value for the penny and the pound. An exhaustive history of the shilling may be found in the great Oxford Dictionary of Sir J. A. H. Murray (1888 et seq.).

SHILOH, shĭ'lō, (1) Palestine, occupied the summit of a high mountain north of Bethel. Its modern name is Seilun. The Ark of the Covenant or Tabernacle (q.v.) rested here from the time of Joshua to that of Eli, when it was carried away by the Philistines. Prior to this Shiloh was the religious seat of the Israelites and a great feast was held annually. The phrase of the Scriptures, «until Shiloh come,» has received considerable attention from theologians, and its accepted interpretation is— «until Christ come,» or «until rest come.» A small village site, 20 miles north of Jerusalem, is identified with the ancient Shiloh. (2) A settlement in Cape Colony, South Africa, in the district of Queenstown, 60 miles northwest by west of King William's Town. (3) There is

one village of this name in Alaska and there are 16 in the United States.

SHILOH, shī'lō (Tenn.), **Battle of.** This engagement, known also as Pittsburgh Landing, was fought 6–7 April 1862, between the Union forces of General Grant, commanding the Army of the Tennessee, and of General Buell, commanding the Army of the Ohio — the latter arriving the night of the first day — and the Confederate Army of the Mississippi under Gen. A. Sidney Johnston, with Gen. P. G. T. Beauregard second in command.

After the battles of Mill Springs and Fort Donelson (qq.v.) Johnston withdrew from Kentucky and Tennessee to the line of the Memphis and Charleston Railroad, and soon after concentrated his army at Corinth, Miss. The Union forces were sent up the Tennessee River under Gen. C. F. Smith, Grant having been ordered by General Halleck to remain at Fort Henry (q.v.), Gen. W. T. Sherman, commanding the advance and seeking to cut the railroad, finding the country above Pittsburgh Landing under water, fell back to that point, and recommended its occupation to General Smith, who had remained at Savannah. Sherman established his division 19 March at Shiloh Church, about two and a half miles back from the Landing, General Hurlbut's division having been encamped one mile out from the river. Grant, having been restored to command, reached Savannah 17 March and sent McClernand's and C. F. Smith's division under W. H. L. Wallace to Pittsburgh. Prentiss' division followed later. Little or no attention was paid to lines of battle or reserves, both Grant and Sherman looking upon the concentration as preparatory to an advance upon Corinth. Gen. Lew Wallace's division was established at Crump's Landing, some six miles below, where, as Grant explained to Halleck, he had a good road which would enable him "to form a junction with the main column, . . . six or seven miles before reaching Corinth."

In regard to this move, Halleck, 20 March, telegraphed: "By all means keep your forces together until you connect with General Buell, and wait till you are properly fortified and receive orders." No attention was paid to this direction as to fortifying, and neither abatis nor rifle-pits were constructed, nor timber felled. Grant in his 'Memoirs' says of this, "When all reinforcements should have arrived I expected to take the initiative by marching on Corinth, and had no expectation of needing fortifications, though this subject was taken into consideration." The further reason given by Grant was that the proper line for fortifying was in rear of the camps as they ran, and could not be easily supplied with water. Sherman, in his 'Memoirs,' writes: "We did not fortify our camps against an attack, because we had no orders to do so, and because such a course would have made our raw men timid"; and in a court-martial case he testified: "To have erected fortifications would have been an evidence of weakness, and would have invited an attack." There was no expectation of an attack. Grant, in his 'Memoirs,' says: "The fact is, I regarded the campaign we were engaged in as an offensive one, and had no idea that the enemy would leave strong intrenchments to take the initiative when he knew he would be attacked where he was if he remained." General Nelson, the advance of Buell on the march from Columbia, telegraphed Grant on 3 April that he could be at Savannah 5 April, and in reply was informed Friday, 4 April, that he need not hurry, as boats could not be ready to take him to Pittsburgh until the 8th. The same day Grant notified General Prentiss: "The review of your division will not take place until Tuesday next." Two days before the time fixed for review Prentiss and his division were prisoners in the hands of the enemy. This conviction that there would be no attack led not only to neglecting all defensive preparations, but to selecting camp-grounds without regard to a line of battle and chiefly with reference to available ground and the convenience of water. Three of Sherman's brigades were established about Shiloh Church and the fourth two miles distant. This wide space was later filled in part by Prentiss' division, leaving extensive gaps on each of his flanks. According to maps of both Grant and Sherman, McClernand's division was camped to the left and rear of Sherman, and nearly at right angles to the latter, with its flank toward the enemy's position. Hurlbut's division was a mile in rear of Prentiss, and W. H. L. Wallace's about the same in rear of Sherman.

There had been a considerable show of Confederate cavalry several miles to the front 4 April, but on the 5th Sherman wrote Grant: "All is quiet along my lines now. We are in the act of exchanging cavalry according to your order. The enemy has cavalry in our front, and I think there are two regiments and one battery six miles out." The same day one of his regiments had been engaged under his orders in cutting a road and bridging a creek in his front for the advance on Corinth. Later in the day Sherman wrote Grant: "I have no doubt that nothing will occur to-day more than some picket-firing," and that he did not "apprehend anything like an attack" on his position. The same day, after Sherman's report from the front, Grant, who had gone back to Savannah for the night, telegraphed Halleck: "I have scarcely the faintest idea of an attack (general one) being made upon us, but will be prepared should such a thing take place. General Nelson's division has arrived. The other two of General Buell's column will arrive to-morrow and next day. It is my present intention to send them to Hamburg, some four miles above Pittsburgh, when they all get here. From that point to Corinth the road is good, and a junction can be formed with the troops from Pittsburgh at almost any point." Grant, the same day, telegraphed Buell: "The enemy at and near Corinth are probably from 60,000 to 80,000."

At the very time of these various interchanges of opinion Hardee's corps was in line of battle within a mile and a half of Sherman's headquarters, having deployed in this position at 10 A.M., 5 April, with General Bragg's corps forming as a second line, and Polk's and Breckinridge's corps, the rear of Johnston's army, closing up. The Confederate army had marched from Corinth the morning of 3 April, expecting to attack Saturday morning, the 5th, but a heavy storm and other causes delayed so that the attack was postponed till Sunday morning, the 6th. Such was the situation Saturday night in the Union camps. While there was a very general feeling among the pickets and

many subordinate officers that the enemy was near in considerable force, it was discredited by Sherman, and so the usual precautionary orders were not given to medical, ordnance, quartermaster, or commissary officers, or to the troops, and no one had any official intimation that a battle was impending, or knew that Johnston's entire army was close to their front awaiting daylight to attack. There had been some strengthening of pickets, but nothing was done which even the suspected presence of the Confederate army would have called for.

General Prentiss, after the war, in the first public utterance on the question of surprise, said: "In reference to the still general inquiry, 'Was our army surprised at Shiloh?' I can only reply for myself that I had not the slightest idea that a general engagement was to be fought that day." He said further: "We were not prepared on the 6th of April"; but "admonished by the action of the enemy on Friday evening," he had strengthened his pickets.

Gen. Andrew Hickenlooper, later one of the principal officers of the Society of the Army of the Tennessee, an officer of note in Grant's army throughout the war, and a strong friend of Grant and Sherman ever after, commanded a battery in Prentiss' division at Shiloh. In the course of an exhaustive review of the battle he says of the general situation: "There had been no order or system in camping; no relation of one command to another; no defined front or known rear, except an impassable river. There was no common directing head or superior officer beyond the rank of division commander placed on the firing line, whom all would recognize and promptly obey." . . . "The night before had been passed by the Union troops in merry-making until the camp sank into a peaceful slumber, from which they were aroused by the roar of musketry and the booming of the guns of the Fifth Battery." As to the early hours of the day of battle, he observes: "The bugle's cheery notes aroused the camp at the dawn of day; breakfast was over, and all was ready for an early morning drill, when the faint reports of distant picket-shots were heard and then came the pattering fire of the reserves, . . . followed by volleys on the right that told of swiftly approaching danger." The pickets of Prentiss were the first to encounter the Confederate advance, and being strongly reinforced, they attacked Hardee's oncoming line. The latter pushed rapidly forward and thrust strong flanking forces into the wide gaps on Prentiss' flanks, thus turning both, as well as Sherman's left, and the right of Stuart — Sherman's isolated brigade.

Sherman's brigades formed on their color-line a portion of the troops being called from their breakfast for the purpose. They advanced between 200 and 300 yards, met the enemy in force and checked his advance for a time, Sherman meantime sending to McClernand for a battalion of cavalry to join one of his "for the purpose of discovering the strength and design of the enemy." It was not until 8 o'clock, however, that Sherman became convinced that it was an attack in force. He thus fixes the time in his official report: "About 8 A.M. I saw the glistening bayonets of heavy masses of infantry to our left front in the woods beyond the small stream alluded to, and became satisfied for the first time that the enemy designed a determined attack on our whole camp." At 10 o'clock most of the advanced Union camps were in the hands of the enemy. There had been no time to strike tents or remove stores or private baggage. Sherman relates that two of his horses were killed at the picket-rope, and that he found them still tied there when the camps were recovered the next day.

In spite of this general surprise and of the tremendous onslaught of solidly formed battle-lines, there was throughout the day much stubborn and even remarkable fighting, in which Sherman, Prentiss, McClernand and Hurlbut were personally conspicuous. After the battle began, Sherman's conduct was beyond praise. There were probably 20,000 men in regiments that maintained their shattered organizations, and in broken groups, in batteries, and in mixed forces rallied by brave officers and men, which, together, without special regard to lines, held with desperate courage against the enveloping enemy. Many of them were killed or wounded before the day ended. But nothing could permanently resist the well-ordered Confederate movement. Grant wrote that when he met Buell at the Landing, which was at 1 P.M., "there probably were as many as four or five thousand stragglers lying under cover of the river bluff, panic-stricken, most of whom would have been shot where they lay, without resistance, before they would have taken muskets and marched to the front to protect themselves."

As the day advanced, the Union line was fast disintegrating. Sherman, testifying under oath at a subsequent trial, said that "at least 10,000 ran away." Prentiss' division was surrendered and captured soon after 5 P.M., having fought and maintained its organization to the last, and given the best illustration of pluck, endurance, and persistence in fighting that the history of the first day affords. Sherman's organization was destroyed, and he, with a small force of his own, was fighting stubbornly with McClernand, whose organization, though much broken, was still maintained. About 2 P. M. Johnston was wounded, and died in half an hour. The transfer of command to General Beauregard caused a lull in the fight, and a delay in movement, but at 5 the Union line had been forced back into a corner between the Tennessee River and Snake Creek, an area which included the landing. Here the line presented a front of about a mile and a half to the enemy. Just as an assault on this position was being delivered at the right of the Confederate lines, Ammen's brigade of Nelson's division of Buell's army, which had marched from Savannah through the swamps, was ferried across the river, and two regiments advanced and opened fire upon the right regiments of the enemy, which, in charging forward, had nearly reached the landing. The assault was checked without severe fighting, but the arrival of fresh troops thus became known, and the Confederate attack ended for the day. At this time Grant's line in front of the landing was held by the broken organization of Hurlbut, W. H. L. Wallace, McClernand and Sherman. There were portions of various organizations available within the protected area, and Lew Wallace arrived during the night with 5,000 men. Buell himself had arrived at 1 P. M., and spent the afternoon in learning conditions and studying the ground, and the night in

posting his troops. Nelson's division was ferried over at night, and advanced on the left; Crittenden's, as the steamers brought it from Savannah, was placed on Nelson's right. Two brigades of McCook's division, which followed Crittenden up the river, were established still further to the right. The Union gunboats *Tyler* and *Lexington* anchored off the ravine next above the landing, and near the close of the first day's fight, fired effectively upon the Confederate right flank and front, as the Union line was forced back toward the river. These boats continued their heavy shelling at intervals during the night, to the great discomfiture of the Confederate camps.

The battle of Monday, 7th, was opened under Buell's orders and direction. His left and centre advanced and became engaged with the enemy's pickets immediately after daylight, and encountered their main line at 6 A.M. McCook's two brigades moved at once into action, and were established still further to the right. The Army of the Ohio pressed steadily forward, and at 4 P.M. had possession of the camps of Stuart, Prentiss and a part of McClernand's. Two brigades of T. J. Wood's division arrived as the battle was ending, but only one reached the front. The action closed soon after 4, Buell's forces at that time covering two miles of the battle line (nearly three quarters of it, extending as it did to the left of Lew Wallace's division), and becoming hotly engaged there, in co-operation with Wallace's left regiment. Wallace, at the close of the battle, held the front of the Army of the Tennessee, McClernand, Sherman and Hurlbut being warmly engaged at the close in connection with the left of Wallace, and the right of McCook. About 5 P.M. the Army of the Tennessee reoccupied its former camps.

When Buell first advanced he was joined by Col. J. M. Tuttle of W. H. L Wallace's second division, who gathered up about 1,000 men of his own command, rallied many more from fragments about his bivouac, and without orders proceeded to Buell's lines, reported to him, and fought with him through the day. At daylight Grant gave Sherman orders to advance on the right. He thereupon sent his staff officers to collect his men and moved forward about 7 A.M. At 9 o'clock Hurlbut moved under Grant's orders to support McClernand, who with Sherman, was then engaged near his former camp. Lew Wallace had advanced earlier and held the right of Grant's army. This division finally swung around upon the ground originally occupied by Sherman's camps, there coming in contact with the right of McCook of Buell's line. Here the battle ended.

The division commanders of Grant's army were J. A. McClernand, W. H. L. Wallace, Lew Wallace, S. A. Hurlbut, W. T. Sherman, and B. M. Prentiss. Buell's divisions on the field were A. McD. McCook, William Nelson, Thomas L. Crittenden and T. J. Wood. The division commanders of Johnston's army were: of Polk's corps, C. Clark and B. F. Cheatham; of Bragg's corps, D. Ruggles and J. M. Withers; of Hardee's corps, T. C. Hindman, P. R. Cleburne and S. A. M. Wood; reserve corps, J. C. Breckinridge. The best estimates of strength give Grant 33,000 at the opening of the battle, and Lew Wallace's reinforcement for the second day 5,000. The official reports give Johnston's strength at 39,000 to 40,000. The losses of Grant's army were 1,513 killed, 6,601 wounded and 2,830 missing; total, 10,944. Buell lost 241 killed, 1,807 wounded and 55 missing; total, 2,103. Total Union loss, 13,047. The Confederate loss was 1,723 killed, 8,012 wounded and 959 missing; total, 10,694. Obreiter) and 'The Battle of Shiloh' (D. W. Reed, Harrisburg 1905); Rich, J. W., 'The Battle of Shiloh' (Iowa City 1911). See also *Bibliography* under CIVIL WAR IN AMERICA.

H. V. BOYNTON,
Late General, U. S. Army.

SHIMODA, shē'mō-dä, or **SIMODA,** Japan, a seaport town on the island of Hondo, at the western entrance of the Gulf of Yeddo, 80 miles southwest of Tokio. It was nearly destroyed by an earthquake and tidal wave in 1854, but was rebuilt, and since 1857, when the Dutch treaty was signed, it has been a free port for foreign commerce. A daily steamer service runs between this port and Tokio in summer. Pop. 5,000.

SHIMONOSEKI, and **MOJI,** shē-mo-no-sĕk'ē, mō'jē, the former originally called Akamagaseki, now popularly known as Bakan: a fortified town, seaport and railway terminus of Japan, at the southwestern extremity of Honshu (the Main Island), situated in 130° 56′ E. long., 33° 57′ 30″ N. lat. on the northern coast of the Shimonoseki Straits. Together with Moji, on the opposite coast, the town holds the key of the western gateway of the Inland Sea The town extends four miles from east to west and has extensive docks where much Japanese and foreign shipping is cleared, though its trade is not so large as that of Moji. Shimonoseki is famous in Japanese history for the sea-fight in 1185, by which the Taira Clan was exterminated by the Minamoto Clan. Here also took place a bombardment of the forts, 5–8 Sept. 1864, by a united squadron of American, British, French and Dutch warships, which landed marines and seized the batteries The situation arose through the action of the Daimyo of Chōshū (in whose territory the town lay), in attempting to keep foreigners away by repeatedly firing on foreign ships that passed his batteries on the coast. The American steamer *Pembroke* was fired upon 25 June 1863; on 16 July United States steamship *Wyoming* destroyed two vessels and attacked the batteries in retaliation. When the combined squadrons (17 vessels) of the four powers brought the Daimyo to terms, the latter agreed to abstain from future hostilities, and thenceforth to supply foreigners with provisions. The Shogun (Commander-in-chief, a feudal office abolished in 1868) was obliged to pay an indemnity of $3,000,000, of which amount the United States received $785,000. The American government returned this sum to Japan in 1883, but without interest. After the Restoration in 1868 Shimonoseki rose in prosperity owing to its geographical situation. The treaty of peace which ended the Chino-Japanese War of 1894 was signed

here 17 April 1895 (ratified 8 May) by Marquis Ito, Japanese premier, and Li Hung Chang for China. Pop. 92,000.

Moji is usually coupled with Shimonoseki as their interests in shipping are identical. The latter is under the jurisdiction of Yamaguchi, 51 miles away; Moji under that of Fukuoka, 47 miles away. The foreign merchants and shipping agents have their offices on the side best suited to their convenience, but the principal Japanese banks and shipping offices are at Moji. That town became important in 1887 when the Kyúshú Railway made it the terminal. It is entirely open to general foreign trade. Pop. 95,087.

SHIN-PLASTER, a bank-note, especially one of a low denomination; a piece of paper money. The term is derived from an old soldier having used a quantity of worthless paper currency as plasters for a wounded leg. See MONEY, PAPER.

SHINER, one of various small silvery fishes of the family *Cyprinidæ*, found in all streams from New England to Kansas and Louisiana, especially in those choked with weeds. They are the object of childish angling expeditions, and sometimes are large enough to be cooked, but should be eaten at once, as the flesh spoils quickly. (See DACE; MINNOW). The moonfish (*Vomer setipennis*) is sometimes called blunt-nosed shiner.

SHINGLE. A shingle is a flat, tapered piece of wood used as a roof covering or for the siding of houses and bungalows. Dating back to the earliest American settlements, the wooden shingle has been used as a roof covering, and only in comparatively recent years has any other roofing material been used by the people of the United States and Canada. Until the latter part of the 19th century the shingles were cut from the nearest woods at hand that best answered the purpose. The earliest settlers on the Atlantic Coast used principally the wood of the White Pine and the Virginia Cedar. As they were made by hand, such woods were selected as possessed a straight grain, split easily and possessed a considerable degree of durability. In the southern part of United States, Cypress is largely used for shingles.

The rapid development of the United States, however, called for large quantities of wood for other construction purposes, and gradually the supply of woods suitable for the manufacture of shingles became exhausted to such a point that woods of more abundant supply were sought. On the Northwest Pacific Coast was found the Western Red Cedar in practically inexhaustible supply, and it was discovered that this species had been used on the Pacific Coast for shingles since the time of the earliest settlements there.

Development of transcontinental railroads made available shingles sawn from this species over almost the whole of North America and to-day 85 per cent of the shingles manufactured are sawn from this wood. Due to its large use in the manufacture of shingles, Western Red Cedar (*Thuja plicata*) is also commercially known as "shingle wood."

At the present time, California Redwood, Southern Cypress, Eastern White Cedar and the Western Red Cedar constitute about 99 per cent of the supply for wooden shingles, but the latter is by far the best known, and most widely used.

On the warm moist slope of the Cascade Mountain Range in Washington, Oregon and the Province of British Columbia, the Western Red Cedar tree is found in great abundance, and in this locality it attains its maximum growth and size. Trees of from 12 to 16 feet in diameter, measured 4½ feet from the ground, are not uncommon. Under average growing conditions, when this tree is mature it will have a clear bole of from 50 to 100 feet. No other American wood is better adapted to the requirements of a wooden shingle than Western Red Cedar. The supply is sufficient to meet all demand. It is durable in the extreme. It is quite easily worked. It has an extremely straight-grain. It is light in weight. It has an oil peculiar to this wood alone that renders it quite immune from the ravages of fungi and insects.

The timber is removed from the woods in either log or "bolt" form. At the shingle mill the timber is cut into the length of shingle desired and is then usually barked and cut into blocks small enough to be handled with ease. The resulting blocks are then placed in a shingle machine, which automatically cuts off the tapered shingles. Any defects are then trimmed off and the shingles cut into the most desirable widths. The shingles are then dropped into large bins, from which they are packed. To expedite seasoning and to reduce the weight for transportation purposes, after packing the shingles are put through a dry kiln, where they are dried for from 7 to 10 days, at the end of which time they are ready for shipment.

Formerly cedar shingles were cut in two standard lengths, 16 and 18 inches, and packed in two standard thicknesses. For the 16-inch shingles, these thicknesses were five-to-two and six-to-two, meaning five shingles at their butts would measure two inches, and six shingles at their butts would measure two inches. For the 18-inch shingles, these thicknesses were five to-two-and-one-quarter and five-to-two. Red cedar shingles are now classified under three different grades, Nos. 1, 2, and 3, each of which is manufactured in three different lengths, 16, 18, and 24 inch.

There are many striking examples of long life peculiar to the roofs of homes covered with Red Cedar shingles. "Lowland," the magnificent mansion of the late George Abbot James, at Nahant, Mass., was built and roofed with Red Cedar shingles in 1872 and is found to be in perfect state of preservation. The old Block House built at Fort Borst in 1845 was roofed with Red Cedar "shakes" (split shingles) and is still in an excellent state of preservation. Many of the pioneer homes of the Northwest that were covered with Red Cedar shingles are yet in service.

Logs of Western Red Cedar have been frequently found in the forests of the Pacific Northwest, over which trees have grown, that have been found by counting their annual growth rings to be over 800 years old. In every instance the logs have been found to be in a perfect state of preservation.

Due to the abundance of timber supply, and the comparatively small amount of capital neces-

sary to finance the manufacture of shingles, there have been a very large number of shingle mills constructed. Since 1916 there has been a trend toward the use of other materials than wood which are to a large extent fireproof. These materials include asphalt compositions, asbestos and copper. City building ordinances in many instances require fireproof roofing materials.

SHINGLES, or *herpes zoster,* an acute infectious disease of man characterized by unilateral inflammation of posterior root ganglion or ganglions of cranial nerves. It is manifested by pain and local redness, followed by the appearance of small vesicles arranged in clusters over the distribution of the nerves affected. These vesicles in the skin are at first filled with a clear fluid which later becomes cloudy and often purulent. The cause is a virus that is similar in shape and size to that of varicella. It occurs only in man and is more common in adults than in children and may appear at any season, occasionally in epidemic form. If it is at all infectious this is only in the early stage of the primary form. Secondary types occur in the course of such diseases as spinal cord tumor, tabes, and syphilis and in those who have been overdosed with arsenic or bismuth. The incubation stage is from a few days to several weeks and an attack is preceded by neuralgic pains and tenderness along the skin area supplied by the affected sensory nerves. The eruption is on one side only and about 75 per cent of the cases are found to have the vesicle situated on levels between the second dorsal and the second lumbar vertebrae. The eruption spreads to new areas as the old ones begin to dry up and heal. Occasionally there is intense pain with deep seated ulceration followed by the formation of scars. Involvement of the fifth cranial nerve is next in frequency, the ophthalmic branch being involved, with pain, excessive flow of tears, intolerance to light and occasionally corneal ulcers. The eruption is seen above the eyebrow. Diagnosis of *herpes zoster* in early stages is sometimes difficult but when attended by the characteristic eruption it becomes evident. Treatment is generally symptomatic. In elderly people who suffer severely sedatives are indicated and opiates are used occasionally. Ointments containing cocaine are seldom helpful. Deep X-ray therapy may be advisable and in the occasional case nerve block or nerve section may be indicated. Complications are unusual except in corneal involvement where vision may become impaired. See also HERPES.

HAROLD WELLINGTON JONES, M.D.

SHINN, Everett, American artist: b. Woodstown, N. J., Nov. 6, 1873. He studied at the Philadelphia Academy of Fine Arts and in Paris. He is known for his pastels and mural decorations, and as a magazine illustrator. He painted the mural decorations at the Belasco and Stuyvesant theaters, New York, and at Trenton City Hall.

SHINN, Florence Scovel, American illustrator, wife of E. Shinn (q.v.), to whom she was married in 1898: b. Camden, N. J., late 19th century. She studied at the Pennsylvania Academy of Fine Arts, and became well known for her book illustrations, which include *Mrs. Wiggs of the Cabbage Patch, Lovey Mary,* and *Coniston.*

SHINNECOCK BAY, shĭn'ē-kŏk, an inlet, indenting the southeastern shore of Long Island west of Southampton. It is about 12 miles long and its maximum width is about two and a half miles.

SHINNECOCK HILLS, low hilly region, Long Island, in Suffolk County between Great Peconic Bay and Shinnecock Bay, 4 miles west of Southampton. The Shinnecock Indian reservation is here.

SHINNECOCK INDIANS, an Algonquian tribe of Long Island, N. Y., formerly occupying the southern coast from Shinnecock Bay to Montauk peninsula. Many of them early joined the Brotherton Indians, and the few that remain live on their reservation of about 400 acres, 4 miles west of Southampton.

Consult Hodge, F. W. (ed.), *Handbook of American Indians,* 2 vols. (1907–10); Harrington, M. R., *Ancient Village Site of the Shinnecock Indians* (New York 1925).

SHINTO, shĭn'tō (spirit-way), the primitive folk-faith of the Japanese, was a typical barbarian religion composed of nature-worship and ancestor- (including hero) worship. Chinese culture, filtering into Japan through Korea, brought with it Confucianism about the 4th century A.D., and Buddhism in the 6th; and these two made with Shinto a religious compound in Japan similar to that which they made with Taoism (see TAOISM) in China, except that Shinto was nearly absorbed by Buddhism, until its resuscitation, from the 18th century onwards. This culminated in its reinstatement in pure form as state religion at the Japanese revolution in 1868, only, however, some years later to be disestablished and declared not a religion, but a state ceremony. Under the influence of modern education, its cult is rapidly declining. This immigrant Chinese culture also made possible commitment to writing of the Shinto myths and legends, 712 A.D., into the Kojiki, "Ancient Records," and of the Shinto rituals, 927 A.D., into the Yengishiki, "Ceremonial Law"; recording their barbarian traits in a naive, unexpurgated form which aptly exemplifies the rise of religion in both creed and cult.

The Japanese theory of origins begins its myths with Izanagi, "Male who Invites," and Izanami, "Female who Invites," a primitive pair that still survive in popular belief. Their begetting of the various islands of Japan—which, as the commentators of old Japan used to explain, have since grown enormously—was performed with the aid of phallic rites (see PHALLICISM) which persisted in Japan until the revolution in 1868. After the decease of his sister-wife, Izanagi produced several deities in various magical ways, and especially three great deities: Amaterasu (Sun) from his left eye, Tsuki-Yomi (Moon) from his right eye, and Susano (Storm-cloud) from his nose, with obvious implication of Izanagi as creative Heaven. Amaterasu-O-Mi-Kami, "Heaven Shines Great August Deity," has always stood supreme, as sun goddess, among the myriad deities of Shinto, and is still worshipped at innumerable shrines throughout Japan. Susano, "Impetuous Male," represents the storm-cloud, now in turbulent strife with his gentle sister, Amaterasu, now quelling destructive fires for man. His rule over Izumo province descends

through six generations to O-Kuni-Nushi, a moon-god who with his son, Koto-Shiro-Nushi, are now popular as gods of wealth, under the names of Daikoku and Ebisu. The former is seated on rice bales, the latter holds a fish, these being the staple foods in Japan.

In accordance with the evolution of religion, the Kojiki now passes from the origin of its gods in myth to the origin of its rulers and priests in legend, and of course secures authority for the latter by derivation of them from the former. Thus the Kojiki relates how Amaterasu produced by magic a son, Ho-Mimi, whose begotten son, Ninigi, at her command, descended from Heaven with a retinue of nobles and priests, deposed O-Kuni-Nushi, and founded that Imperial Dynasty which still after two millennia rules in Japan, "in lineal succession unbroken for ages eternal." The Imperial Oath, prefaced to the Constitution of Japan, promulgated in 1890, appeals to the "Imperial Founder of our House," namely, Jimmu Tenno, greatgrandson of Ninigi, who was in turn supposititious "sovereign grandchild" of Amaterasu-O-Mi-Kami. The "Heaven" from which Ninigi, with his nobles and priests, really descended was Korea, as the Kojiki naively implies and as certain monuments show.

After his abdication and dealth, O-Kuni-Nushi became (according to his Kyushu conqueror) as "Great Deity of Miwa," ruler of the "invisible," by which was meant the world of thought and secret action which escapes the notice of the earthly ruler. The tutelary gods of every province must report at O-Kuni-Nushi's shrine in Izumo every October (hence called everywhere except in Izumo the "godless month") upon the condition of each individual's soul. O-Kuni-Nushi then punishes or rewards by means of the natural good and evil that befall men. Later he became a ruler of the dead. The mythical element in the Kojiki now decreases and legend passes into annals which close in the 5th century A.D.

The ancestor and hero worship of Shinto was absorbed by Buddhism, since the latter professed especial knowledge about the future life; though each district managed to retain an Ujigami, Clan god, to whom infants were presented for adoption and naming. Hero worship is maintained mostly in these Ryobu, "Two Faced," shrines. Such were Tenjin-Sama, "Heaven Spirit Lord," originally the minister of state and scholar, Michizane of the 10th century A.D.; Hachiman San, an apotheosis of the Emperor Ojin of the 4th century A.D., as God of War; Ieyasu and Iyemitsu, 17th century shoguns of Japan, with gorgeous temples at Nikko; and Motoori, a patriotic scholar apotheosized during the last reign. Until the revolution in 1868 two *living* persons were regularly treated as divine; the Mikado still styled Tenshi Sama, "Heaven Son Lord," descendant of Amaterasu-O-Mi-Kami; and the high-priest of the Izumo O Yashiro, being the 76th generation from O-Kuni-Nushi, and until 1868 styled Iki-gami, "Living-god."

The Yengishiki, "Ceremonial Law," compiled 927 A.D., from much older sources, is a worthy companion to the Kojiki. It contains 27 rituals, which consist, not of free petitions, but of statements of the *grounds* upon which the offerings, which are the essential thing, are made, namely the reception of some natural good. The famous Obarsi, performed for the whole nation June 30 and December 31, affords a single exception to this quest for natural good. The Kagura is a popular occasional ceremony, a peace offering of food, music and dancing made to any deity by the temple attendants—usually the daughters of the resident priest—at the request and expense of any worshipper. The priests marry, their office is hereditary, but may at any time be abandoned, and distinctive dress is worn only when they are officiating. They make no claims to personal sanctity or authority.

The infrequent preaching of the priests always appeals to the examples of the gods, and for positive rules to the laws of that Tenshi Sama who rules by divine right. As for the rest of conduct, "Human beings, having been produced by the spirit of the two Creative Deities, are naturally endowed with knowledge of what they ought to do and what they ought to refrain from. It is unnecessary for them to trouble their heads with systems of morality."—N. Matoori. The Kurozumi, a sect founded a century ago, and now having about a million adherents, practises mental healing by various rites, and by accord with two commandments: Thou shalt not be without a constantly believing heart. Thou shalt not yield to anger nor grief.

SHIP. A ship is a large vessel intended for navigating the ocean. Technically a ship is a vessel carrying not fewer than three masts rigged with square sails. In the present day ships are of two kinds, steam or motor (Diesel propelled), sail having vanished. For a history of wind ships see the article SAILING VESSELS, and for a historical sketch of steamships, see the article STEAM VESSELS. A detailed description of vessels used in naval warfare will be found under the title WARSHIPS.

A ship has three principal dimensions: length, beam, and depth. Two lengths are commonly referred to, namely: length, overall, and length between perpendiculars. Length, overall, is the straight-line horizontal distance between the extreme ends of the ship; length between perpendiculars is the straight-line horizontal distance between the forward side of the stem and the after side of the rudder post at the ship's designed load waterline, through which points the designer erects perpendiculars from the base line when laying out the line drawing. The beam is the maximum width of the ship measured at right angles to the length. Beam, molded, is the maximum width of the ship, less the thickness of the plating on both sides. Depth, molded, is the distance from the top of the keel plate to the underside of the upper-deck plating at mid-length. That part of the depth of a ship below the water-level is called the draft; that part above the water-level is termed the freeboard. The draft and freeboard vary according to the weight of cargo carried, the draft being more and the freeboard less when the weight is greater.

The principal requirements of a ship are buoyancy, stability, strength, capacity, and speed. The buoyancy of a vessel depends upon its ability to displace a greater weight of water than the weight of the materials of which it is built. The weight of water (in tons) thus displaced is called the displacement of the ship; and, as salt water is heavier bulk for bulk than fresh water, with the same load a ship will ride higher in salt water than in fresh. The center of buoyancy is equivalent to the center of gravity of the mass of water displaced by the ship. When the ship is at rest

in placid water it is located at a point in the vertical line passing through the center of gravity of the ship. It is the point at which the pressure of the water in which the ship floats is theoretically centered—as the *force* of buoyancy. This force, however, acts not at the center of buoyancy, but vertically upward through that center. As the ship rolls under the action of waves or of wind the center of buoyancy shifts. In Fig. 1, the continuous lines show a sectional diagram (amidships) of the vessel at rest in placid water: the dotted lines show the vessel heeled over by wind and wave. The center of buoyancy has swung from B to B′; the center of gravity moves to G′. XB′ shows the line of the force of buoyancy, and G′Z the length of the arm of the righting moment (product of buoyant force and arm) tending to right the ship to an even keel. Stability is that quality of a ship by virtue of which it resists overturning. The nearer the center of gravity of the ship can be brought down (in the loading) to the center of buoyancy, the more stable the ship—that is, the greater the force which must be applied to raise the center of buoyancy above the center of gravity and cause an overthrow. In other words the stability of a ship depends upon the relative positions of the

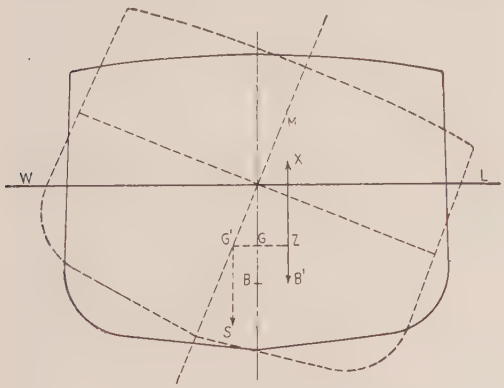


Fig. 1.

center of gravity and the center of buoyancy. The center of gravity is discovered by a calculation of the various weights making up the ship's total displacement. Another series of calculations based on the form, or proposed form of the ship, will determine the position of the center of buoyancy. A graphic method of determining the position of the center of buoyancy consists of cutting from cardboard a series of equally spaced cross-sections of the ship drawn to scale and gluing them together with their center lines and load-water lines matching as in Fig. 2. Several groups of these cross-sections are made, one for each angle of rolling. Equidistant parallel lines are drawn across each model, representing the position of the vessel with different loadings. The divisions are cut off in succession from the top line, and the remainder after each cutting is carefully weighed and recorded for purposes of comparison. Before each cutting the combination of cross-sections is suspended from a nail, allowing it to hang freely, and a plumbline hung from the same point of support. The model is hung first from one corner and then from the other—as shown in Fig. 3, where PL represents the plumbline in the first suspension, QR, the position of the plumbline in the second suspension, and B, the center of buoyancy found by their intersection. From B a line is projected vertically upward—that is at right angles to the waterline to which the ship is assumed to roll. The extension of that line until it meets the center line GK of the ship's molded form gives the point M, known as the metacenter. In discussing the principles of flotation, the ship is often considered a pendulum whose point of suspension is at the metacenter. The higher this point is above the center of gravity (G), the more stable the ship. As M is made by the ship's form or the loading to approach G, stability diminishes,

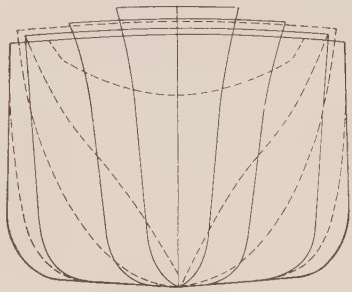

Fig. 2.

and when M passes below G the equilibrium is unstable, and overturning is imminent. The horizontal distance (GZ) from the center of gravity to the vertical line passing through the center of buoyancy and the metacenter represents the arm of the moment operating to right the vessel; that is, when the lines of the model are drawn to a standard scale.

Finding the center of gravity is a much more complicated process. The necessary calculations are too extended to be reproduced here and the reader is referred to technical works on naval architecture for study of the problem. A mechanical method is often employed and when ex-

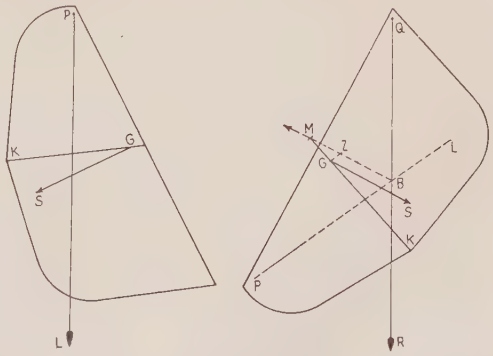

Fig. 3.

treme care is exercised the results are sufficiently accurate to serve every practical purpose. The "light" ship—that is, with no fuel, stores, or cargo on board—is subjected to what is known as an "inclining experiment." The ship is heeled over from an upright position by the moving of a weight from one side to the other. The trial must be made in perfectly calm weather, in placid water, and the weight should be large enough to roll the vessel through an arc of at least two degrees. For a vessel with a 70-foot beam a weight of 10 tons is required. Large concrete blocks are commonly used. A long plumbline is suspended inside of the ship and its deflection is

measured after each movement of the inclining weight. Knowing the length of the plumbline, the weight of the inclining block, the distance each weight was moved, and the deflection of the plumbline, and having previously calculated the position of the metacenter, M, the distance GM is then found by routine calculations and the position of center of gravity, G, is then known.

Trim, as applied to a ship, is allied to its stability. The term signifies the condition of draft as related to length. For example, if the draft forward is one foot less than the draft aft, the vessel is said to have a trim of one foot by the stern. A trim by the head would mean that the draft forward was the deeper.

Strength of structure is necessary to withstand the stresses to which the ship is subjected by wind and waves. In order to calculate these stresses the vessel is regarded as a girder supporting the various weights of cargo, engines, fuel, etc., acting downward; and also acted upon by the force of buoyancy acting upward. This girder is studied in two situations: First, as lying across the trough between two waves, supported at each end by deep water with its large lifting stress and by shallow water with very little supporting power at the middle; this is called the "sagging" stress. The other critical position is that where the middle of the ship's length is supported by the deep water of the crest of a wave and both

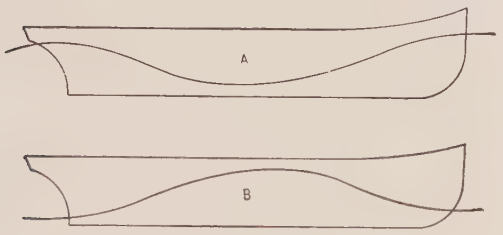

Fig. 4.

ends are in troughs; this is called the "hogging" stress. These two conditions are illustrated at A and B respectively in Fig. 4. The strength of the ship proper is thus quite distinct in meaning from the local strength of various parts designed for certain purposes, as for the distribution of the weight of the engines, the thrust of the propeller, the supports for hoisting cranes, and the like.

The capacity of a ship is her ability to carry stores and cargo, together with crew and passengers. The greater this capacity is in proportion to the size, and the greater the speed of the vessel, the greater is her utility. The more lightly a vessel is built the greater will be her capacity for her size; but the lightness of a vessel is limited by the need of strength to resist stress. Capacity is also to some extent dependent on form, and the form which is most conducive to high speed is not necessarily that which gives the greatest capacity for stowage. The speed and the maneuverability of a vessel depend on her underwater form.

Given equal propelling power, length, beam, and draft, the ship with the finer underwater form will have the less resistance and, hence, will be faster. Long hollow (concave) lines forward and aft are faster than short full (convex) bows and sterns. Hull resistance may be divided into frictional and residual. The frictional resistance is that caused by the water passing over the underwater surface (wetted surface) of the ship. At low speeds, frictional resistance is predominant. Since frictional resistance is proportional to wetted surface, the less underwater surface, the less resistance. A fine shape has less wetted surface than a full one. Residual resistance is that caused by the eddies and waves which the ship makes as it passes through the water. Eddies and waves require energy to create. The energy which creates the waves and eddies associated with the passage of a ship through the water comes from the ship's power plant. That energy is wasted instead of being transformed into propulsive effort. Negligible at low speeds, residual resistance builds up rapidly as speed is increased. Eddy-making is largely dependent on the shape of the stern. The finer the stern, the less eddying or turbulence in the wake of the ship and, hence, the less resistance. Wave making, in turn, is dependent mainly on the shape of the bow. At a given speed a fine bow will have a smaller wave-making tendency than a blunt one and its resistance, therefore, will be lower.

Ship Design.—As the first step in the building of a ship is the designing of it, the use to which it is to be put must first be decided on. What cargo is it to carry and how much? And what speed is desired? The answer to these questions will go far in determining the ship's dimensions—length, beam and depth—and to a large extent the shape or "lines" of the underwater body and the horsepower of its propelling machinery. The available depth of water in the harbors the ship is designed to visit is another controlling factor.

As the dimensions of the ship are not known, a trial design is first calculated upon the basis of the tonnage required; say, for example, 10,850 deadweight tons. The designer makes a calculation of a hull which will afford the space for 10,850 deadweight tons. Besides cargo, the weight of the necessary fuel, freshwater, and stores is included in the desired deadweight tonnage. The displacement of the completed ship will be the deadweight tonnage plus the weight of the ship itself (light displacement). From experience and experiment with the type in question it has been found that about 41–100ths of the whole carrying capacity (including fuel, stores, etc.) must be added for the vessel itself. The ship carrying 10,850 tons will, therefore, have a displacement of about 15,300 tons. It devolves then upon the designer to determine length, beam, and depth for his vessel from this total displacement. Into this problem enters first, if at all, the available depth of water in the harbors where the ship will trade. The shallower the possible draft, the greater, relatively, the beam. Aside from this the desired speed determines the proportion of length to breadth. The longer the ship—and the narrower—the speedier she will move for the same engine power. A trim underwater body with long gently flowing curves will require less horsepower for a given speed than a body which is full and roomy well up to the bow and back to the stern.

For all of the calculations "constants" and "coefficients" are available to the designer, and his ship of 15,300 tons will, in ordinary course, figure out a length of between 450 and 460 feet and a beam of 58 to 62 feet, a draft of 28 to 30 feet, with a total depth of about 40 feet. With engines of 8,000 horsepower this vessel should show a speed of about 17 knots.

In the planning of the ship, the established rules of the American Bureau of Shipping or

some other classification society must be strictly adhered to in order that the vessel may be insured.

After the naval architect has established the principal dimensions, hull form, and general arrangement of the ship, he is confronted with the problem of designing a structure, generally of steel, sufficiently strong to meet the needs of the service in which the vessel will be engaged. It is at this point that the construction rules of a classification society are consulted. Based on a vast background of experience, they enable the designer to select proper sizes of structural members without spending excessive time in making trial calculations. From these rules a structural drawing of the midship section is developed. This drawing is, in effect, the master plan for the structure of the ship, the sizes of the hull members at various distances forward and aft being related by the rules to the sizes or scantlings

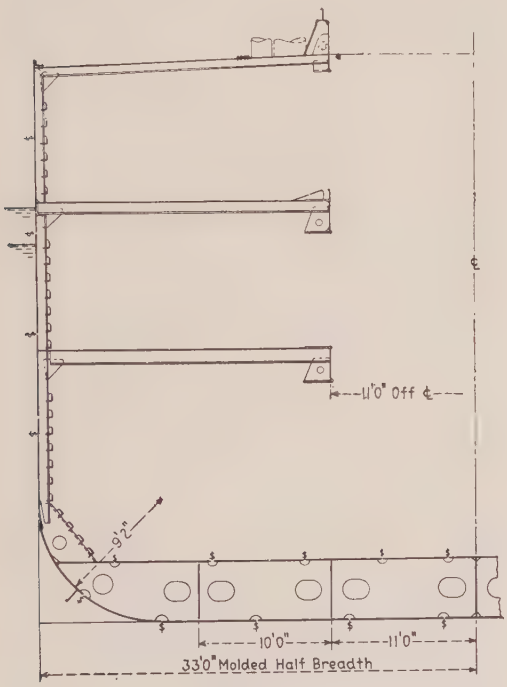

Fig. 5.

amidships. Lest it be thought that classification society rules have a stultifying effect on structural design, it is emphasized that these rules are constantly being studied in the light of new developments, and that they serve as examples of successful practice against which departures from custom can be compared and evaluated. The rules were developed to serve as standards for judging whether or not a ship can prudently be insured. Actually the rules offer the designer a wide latitude for the exercise of ingenuity in providing a structure which will meet their basic strength requirements.

A simplified midship section of a transversely framed, modern, all-welded dry-cargo ship is shown in Fig. 5. The actual drawing developed by the naval architect shows a mass of detail and is encumbered by numerous notes which will be followed in the development of the other structural plans.

The locations of the strakes of plating amidships, along with their sizes, appear on the midships drawing. Development of plans showing the disposition of plating throughout the hull require a three dimensional study which is most conveniently carried out by making a half model or a model of one side of the ship, and drawing the outlines of the strakes of plating thereon. Dimensions can then be measured on the model and the several plating drawings can be developed therefrom. Fig. 6 shows the strakes of plating laid out on a body plan.

The hull of the ship derives most of its strength from the shell and deck plating. All other parts of the ship, that is, the framing, can be considered as practically the support and stiffening of the plating. In a large vessel the pressure of the water upon its exterior shell is high, the tendency being to cause collapse. This pressure is increased by the violent blows of waves, and from the pitching and rolling sustained in rough water. Herein lies the demand for the knowledge of the skilled engineer, that the metal of which the ship is constructed shall be so disposed as to afford abundant strength and resistance to every possible stress and strain

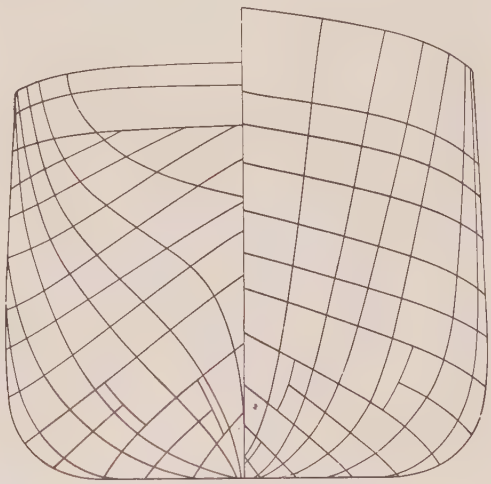

Fig. 6

from without. Another series of stresses arises from the load carried by the vessel, and acting from within, of great magnitude when the waves are high and the ship is subjected to a hogging stress when lying across the crest of a wave, or to a sagging stress when lying across the trough between two waves. It is customary to regard the ship's structure as a beam so far as the amidship's part is concerned. The ends of the vessel from their wedge-shaped construction are from that condition relatively stronger and may safely be more lightly built. The art of the shipbuilder is in the skillful adjustment of material to its purpose, so disposing it as to afford abundant strength, without interfering with generous cargo capacity.

There are two basic methods of reinforcing the shell plating of a ship, namely: the transverse system and the longitudinal system. In the transverse system, closely spaced frames, made of steel channels or angles, are set up in planes perpendicular to the vertical centerline plane of the ship. Extending from the upper deck to the double bottom, they are attached to the side plating either by rivets or welds, and to the deck

beams and double bottom by plate brackets. While transverse frames do not contribute to the longitudinal strength of the ship, leaving this work to be accomplished by the shell and deck plating, they do resist transverse buckling and present smaller protrusions into the cargo-carrying space or holds of the ship. Hence, the transverse system is favored for dry-cargo ships.

The longitudinal system of framing employs deep plate frames or stringers running lengthwise along the shell, supported at wide intervals by deep transverse frames called web frames. Since the longitudinal frames resist longitudinal stresses, the thickness of deck and shell plates may be decreased in a vessel so framed with the result that the hull structure is lighter. At the same time, longitudinal frames resist transverse buckling. Oil tankers, whose cargo conveniently stows itself around the deeper inboard protrusions of the longitudinal frames, usually employ this system of framing.

Actually each system employs some of the features of the other because a few longitudinal stringers are employed with transverse framing, and a few transverse frames are employed with longitudinal framing. Where both systems are extensively employed at the same time, a cellular framing effect is produced which possesses great strength and is often found in warship structures.

No matter what system of framing is used, transverse bulkheads are installed as main strength members, as well as a means of subdividing the hull into compartments. As strength members, the transverse bulkheads, which are walls of steel plate, stiffened by steel angles or channels, are erected perpendicular to the keel and extend from side to side; they resist transverse buckling, support the decks, and serve as a means of anchoring longitudinal frames and stringers in position. These bulkheads are made water-tight to prevent flooding of adjacent compartments if one compartment is stove in.

The extensive use of welding in modern steel shipbuilding permits the designer to create a much lighter and stronger hull than was permitted by riveted construction. The flanges and laps required to fasten frames to plates or plates to plates with rivets are eliminated by welding, thus decreasing the weight, and the welded joints are stronger than those joined by rivets. Since there is a certain amount of play or slip in riveted joints, they are still employed in large vessels where the designer fears that welding will make the hull too stiff to withstand the constant bending it undergoes in a seaway. Thus, in a large welded tanker, the seam of the plating just above the turn of the bilge and the attachment of the uppermost strake of plating to the angle forming the corner of the deck and side shell will be riveted to permit the vessel to bend or work freely. Besides saving weight, welding also offers considerable saving of time during construction.

To save weight, the designer has turned to the use of aluminum and high-tensile-strength steels for the construction of superstructures. Aluminum alloys have been developed which withstand the corrosive action of salt spray and they permit much lighter superstructures than does the mild steel employed in the hull itself. Designers look forward to the day when it will be economically practicable to construct all-aluminum hulls for ocean-going vessels. Being stronger than mild steel, thinner plates can be employed in a deck house built of high-tensile steel.

The division of the hull into watertight compartments is a feature of present shipbuilding regarded as indispensable, particularly as regards the "collision bulkhead," placed near the bow, to keep out the sea in case the bow is broken by collision. The requirements of the International Convention for the Safety of Life at Sea are that the compartments shall be of such a size that the vessel may still float safely if two of them are breached. This provision demands at least eight transverse bulkheads in the ordinary passenger liner. The compartments are connected by watertight sliding doors which are operated from the bridge, in case of emergency.

Given the hull, the remaining problem is its propulsion. A certain model of hull will be found to have a definite economic speed. Above this speed the engines labor without corresponding effect. This economic speed can be calculated very closely by the shipbuilder from the under-water lines of his design and checked by towing a model in a towing tank. He is thus able to decide upon the size of the propeller or propellers needed—their diameter and pitch, and the number of revolutions they must make per minute to drive the ship at the desired rate.

Engines powerful enough to turn the propeller at the desired number of revolutions per minute may then be designed or selected. There are three main types of propulsion machinery from which the designer may choose, namely, reciprocating steam engines, steam turbines, or Diesel engines. The reciprocating steam engine, with the exception of the Unaflow type, was thought to be a thing of the past, at least in the United States, until the advent of World War II, when it developed that they were the only engines which could be built in time to meet the needs of the Liberty-ship program. Although reliable, and comparatively easy to build and operate, the modern triple-expansion reciprocating steam engine consumes an inordinate amount of fuel per horsepower-hour compared to other prime movers. For this reason, from the commercial operator's viewpoint, the Liberty ships were obsolete before they were built.

The Unaflow reciprocating steam engine has remained competitive with the Diesel engine in the 1,500–5,000 horsepower range, its higher fuel consumption being offset by simplicity of operation and low maintenance costs.

For ocean-going vessels the designer usually finds himself confronted with a choice of steam-turbine or Diesel machinery. Much has been said about the relative merits of turbines and Diesels. The Diesel engine, which is a close cousin to the gasoline engine, requires no boilers and consumes about 40 per cent less fuel per horsepower-hour than the turbine. The boilers which supply steam to the turbine, on the other hand, burn a cheaper, less refined grade of fuel oil. Considerations of weight, space required, and maintenance costs also enter the picture. Faced in 1950 with the need of repowering two old sister ships, an important American ship-operating firm decided to try to settle the issue to its own satisfaction by replacing the engine of one with a steam-turbine installation and the engine of the other with a Diesel power plant. Set up as a controlled experiment, the data obtained over a period of years should produce some conclusive evidence as to which is best in that operator's particular service. This experiment is mentioned merely to show that the ques-

tion, at least in the United States, lacked a conclusive answer five years after the end of the second World War.

In the United States almost all new ocean-going ships are turbine driven. The majority of new European ships employ Diesel engines. The Diesel engine, however, has all but eliminated other prime movers for propelling new American workboats such as tugs, towboats, ferryboats and fishing craft.

Oil is the accepted fuel for new ships, even in regions like the Great Lakes which have easy access to an abundant supply of coal. Should the energy released by atomic fission prove a practicable source of power for marine machinery, it is anticipated that it will first be used to generate steam to drive a turbine.

Having selected an engine or turbine with sufficient power to drive his vessel, the designer is confronted with the problem of transmitting its power to the propeller so that both engine and propeller will revolve at their most efficient number of revolutions per minute. The engine will be most efficient at one rotative speed, the propeller at another.

Propellers operate most efficiently at a comparatively low number of revolutions per minute. Some prime movers, such as turbines and high-speed Diesel engines, are most efficient at comparatively high rotative speeds. When such machinery is installed, it is connected to the propeller shaft either through reduction gears or electric transmission (high-speed prime mover turns an electric generator which supplies electric current to a low-speed electric motor directly coupled to the propeller shaft) which permit both prime mover and propeller to operate at their most efficient rotative speeds. Some prime movers, such as reciprocating steam engines and the heavy, slow-speed Diesels, have rotative speeds which are in the range of efficient propeller speeds, and, hence, can be coupled directly to a propeller shaft without sacrifice to either propeller or engine efficiency.

Tonnage.—There are four types of tonnage measurements commonly encountered when ships are under discussion. Displacement tonnage and deadweight tonnage are measurements of weight, the ton here being the long ton, equivalent to 2,240 pounds, while gross tonnage and net tonnage are measurements of the cubic capacity of the ship, the ton in this case being equivalent to a space of 100 cubic feet. Displacement tonnage is the weight of water, in long tons, displaced by the ship. It is the same as the weight of ship plus the weight of everything in the ship. Knowledge of the displacement of ships at their designed load waterlines is the most satisfactory means of comparing them for size.

Deadweight tonnage represents the weight-carrying ability of the ship. It is the weight of cargo, fuel, fresh water and stores which will bring the light ship down to her designed load waterline.

Gross tonnage is the cubic capacity of the ship, including that of hull and superstructure with the exception of certain spaces such as the pilot house, galleys, and companionways. Net tonnage is that which remains after the cubic tonnage of such spaces as engine rooms, ballast tanks, and crew's quarters are deducted from the gross tonnage. It is a measure of the space available for carrying passengers and cargo.

Modern Ships.—The modern passenger liner, offering appointments equal to those of the finest hotels ashore, is an engineering masterpiece designed to drive through ocean waves at speeds varying between 20 and 35 knots. It is a combination of grace and strength, reflecting the accomplishments of many arts and sciences. Valuable as naval auxiliaries, many liners are designed for quick conversion to troopships in time of war.

The largest ships in service in 1951 were the Cunard-White Star superliners, *Queen Elizabeth* and *Queen Mary*. In that year a third superliner, *United States,* somewhat smaller than the Queens, was floated out of her building berth at the yard of the Newport News Shipbuilding and Dry Dock Company, Newport News, Va., and was scheduled to enter the United States Lines Company's transatlantic service in 1952.

The *Queen Elizabeth,* the larger and newer of the Queens, completed as a troopship in 1940, is 1,029 feet long, overall, has a beam of 118 feet 6 inches, and a draft of 39½ feet. Capable of accommodating 2,283 passengers, 823 first class, 662 cabin class and 798 tourist, she is propelled by steam turbines geared to four propeller shafts. Although details of her maximum power output have not been published, she is reported to deliver 160,000 shaft horsepower when cruising at 28½ knots. She measures 83,673 gross tons.

Few reliable details have been published concerning the new *United States.* When completed she will be the largest vessel built in the United States. Driven by geared turbines turning four five-bladed propellers, she is reported to be 990 feet long, overall, with a beam of 108 feet. Her prospective owners and the firm which designed her chose to keep her principal characteristics a mystery.

Among the newer passenger liners may be mentioned the Cunard-White Star vessels *Mauretania* and *Caronia,* the former a vessel 772 feet long, delivered in 1938, and the latter, 715 feet long, which entered service in 1949. Both have steam-turbine propulsion plants and are engaged in the transatlantic trade, but the latter sees service as a cruise ship during the slack season on the North Atlantic.

First-class American entries in the transatlantic passenger service include the *America,* a ship 723 feet long, employing geared turbines with a normal output of 34,000 shaft horsepower, enough to drive her at 23 knots, which entered service in 1940, and the American Export Lines' new twins, *Independence* and *Constitution,* which made their debuts in 1951. Anyone familiar with high-class passenger liners, will, upon inspecting these three ships, leave them with the knowledge that their appointments, construction, and machinery are every bit as good, if not better, than those built by other nations.

As indicative of the equipment of a modern steamship, the following brief description of the *Independence,* launched at the Bethlehem Steel Company's Quincy, Mass., shipyard in 1950, and designed for service between New York and Mediterranean ports, may be of interest. She is the first transatlantic luxury liner to have not only all passenger accommodations but also the entire quarters for officers and crew completely air conditioned. Her trial speed of more than 26 knots gives her the distinction of being the fastest American merchant vessel completed up to 1951. At her normal cruising speed of 22½ knots, she will arrive at Naples from New York in eight days.

Independence is 682½ feet long, has an 89-foot beam, and displaces 30,090 tons at her designed draft of 30 feet. Her depth, molded, to the promenade deck, amidships, is 70 feet 10 inches. This vessel has a gross tonnage of 29,496, a net tonnage of 11,166, and, at her 30-foot draft, lifts a deadweight of 12,309 tons.

In all, there are ten decks; the lowest two of these are discontinued amidships to provide space for the machinery and some fuel and water tanks. Fourteen principal watertight or oil-tight transverse bulkheads divide the hull into 15 major compartments. The two complete engine and boiler rooms are separated by a watertight auxiliary machinery compartment, thus eliminating the possibility of flooding both engine rooms by the penetration of one bulkhead.

Her geared steam turbines deliver a total of 37,000 horsepower to the two propeller shafts at the vessel's normal cruising speed of 22½ knots, but they are capable of a continuous output of 55,000 horsepower. At 22½ knots she has a cruising range of 19,000 nautical miles.

The four watertube boilers in the *Independence,* at normal cruising speed, each supply 77,500 pounds of steam per hour to the turbines at a pressure of 627 pounds per square inch and a temperature of 840°F. Exhaust steam from the two sets of turbines is condensed in horizontal, single-pass condensers producing a vacuum of 28½ inches of mercury at normal power when supplied with 75°F. seawater at the rate of 34,000 gallons per minute.

The main-reduction gear sets incorporate the largest low-speed gears manufactured in America, measuring 174.7 inches on their pitch diameters and weighing 63,000 pounds each.

Electrical power on the *Independence* is produced by four 1,100-kilowatt turbine-driven generator sets. The electrical load of the lighting system alone is 750 kilowatts and the all-electric galleys require 500 kilowatts. The vast majority of the vessel's auxiliary machinery and equipment is driven by electric motors.

Twenty-eight large central-station type air-conditioning systems control the temperature and humidity in all passenger and crew spaces. These spaces encompass a volume of about 1,040,000 cubic feet and are supplied with 195,000 cubic feet of conditioned air per minute.

Accommodations have been provided for a total of 1,003 passengers in first, cabin, and tourist classes. Three hundred and fifty staterooms and 21 public rooms are located on eight decks serviced by six main staircases, four passenger elevators and three service elevators. Areas provided for passengers' service include two hospitals, two galleys, five deck pantries, a soda fountain, three bars, a laundry, and tailor, photo, gift, barber, and beauty shops.

Manned by a crew of 577 officers and men, the *Independence* was built at a cost exceeding $28,000,000.

Most medium-sized passenger ships built in Europe are propelled by Diesel engines. Notable among the newer motorships are the Union Castle Mail Steamship Company's 703-foot *Capetown Castle,* operating between Britain and South Africa, and powered by two sets of 10-cylinder double-acting two-cycle Diesels which deliver a total of 26,000 horsepower; the Swedish-American Line's 503-foot *Stockholm,* whose engines put out a total of 14,600 horsepower on its transatlantic runs; and the Royal Rotterdam Lloyd Line's *Willem Ruys,* a 30,500-horsepower, 580-footer designed for the run from Holland to the Far East.

Dry-cargo vessels and tankers compose the vast majority of the ships which ply the oceans in the service of commerce. The trend, today, is to larger and faster vessels in these classes. Whereas America's 525-foot, 12,910-deadweight-ton Mariner-class vessels, laid down in 1951, were about the same size as the largest dry-cargo ships built in the United States during World War II, their 20-knot cruising speed was considerably higher than the 17 knots which their predecessors could make. Their high speed is a military feature which few European-built freighters possess. Since the Mariners represent the latest official American opinion regarding the type of dry-cargo ship best suited for the nation's wartime needs, it is interesting to note that they can carry 2,410 deadweight tons more and have cruising speeds 1½ knots better than that of the *Schuyler Otis Bland,* designed in 1949 as a prototype for an emergency shipbuilding program, and delivered in 1951.

It can truly be said that America has pointed the way to larger tankers. In fact, the tankers which slid off American ways in the late 1940's were so big they were dubbed "supertankers." The 16,700-deadweight-ton tankers built for the United States Maritime Commission during World War II were considered large ships for their type. Shortly after the war, however, American owners placed orders for tankships with deadweight tonnages as high as 30,000, and in 1951 an American firm placed orders with a German yard for two tankers of 40,000 deadweight tons each. A 30,000-deadweight-ton tanker is about 660 feet long, overall, has an 85-foot beam and, when loaded, has a draft of 34 feet. The 40,000 tonners are expected to be over 750 feet in length. Their great size limits the trades in which the "supertankers" can be used, but, since they require no larger a crew than do 16,000-ton ships, they offer considerable economies when they can be used.

Cargo and Ballast.—When the articles in a ship's cargo are heavy and light, the heavier are placed nearest the bottom, to increase the ship's stability. When, however, all are heavy, there may be danger of making a ship too stiff with low stowage; so that, not being balanced, she will snap back to upright after taking a roll, to the discomfort and danger of passengers, crew, and cargo. To obviate this danger some of the cargo should be raised; if steel, some should be stowed between decks; if coal or salt, it may be heaped up in the center, taking care to secure it against shifting, should the ship be knocked down by a sea or squall. Heavy articles should never be placed toward the extremities, lest they promote pitching. The cargo and the ship should be considered as one integral whole, every precaution being taken in loading to preserve the proper relations between the center of gravity and the center of buoyancy. In all cases care must be taken to preserve the trim of the ship—that just proportion between her draft forward and aft which the estimate of the builder, or, when a voyage has been made, experience itself, has determined to be most favorable to speed. See also NAVIGATION; SHIPBUILDING INDUSTRY AND CONSTRUCTION.

SHIP CANALS. See CANALS.

SHIP IN ART AND SYMBOLISM. As symbol of the state a ship has been used from very distant times; as such it is depicted as steered by its statesmen through the shoals, rocks, and storms of internal troubles, false policies and the machinations of enemy countries. In Christian symbolism also the ship takes the same significance. It was depicted riding in safety amidst storms as emblematic of the church in the early days surviving the direst persecutions. Frequently the mast and yardarm are used to signify the Cross and the peak of the mast is surmounted by a dove or the sacred monogram. The symbol of the ship is dilated on by early Christian writers, as Saint Clement of Alexandria. In the catacombs hanging lamps have been discovered in the form of masted ships, and the design appears frequently on the catacomb walls. Sometimes the ark of Noah takes the place of the masted ship. Often, however, in ancient times, as at present, the ship is introduced as an emblem of maritime power. In ecclesiastical art a ship has been pictured in the hands of Saint Jude; Saint Ursula has been depicted with a ship near her, or as landing from a ship; Saint Melanius has been portrayed as lying dead on a ship which is sailing against the stream; Saint Castor has been pictured saving a ship from sinking; Saint Werenfrid has been represented with a ship in his hand having a coffin in it; Saint Anselm has been portrayed holding the model of a ship, as has Saint Mary of Succours (Husenbeth). The term ship is used for the ecclesiastical vessel that holds the incense, but it is usually of *boat* form. The finest centerpiece for the banquet tables of the Middle Ages was a ship of gold or silver made as a masterpiece of the goldsmith and termed a *nef*.

CLEMENT W. COUMBE.

SHIP MONEY, a tax which had much to do with provoking the rebellion which cost Charles I his head. It was customary in England in times of extraordinary peril for the sovereign to call upon the seaports and maritime counties to supply ships-of-war for the national defense. The ships which took part in the defeat of the Spanish Armada were obtained in this way. No such peril existed when Charles I, in October 1634, ordered the magistrates of London and other seaport towns to provide ships-of-war, and also empowered the magistrates to levy a tax for that purpose. Resistance to the levy was met by further decrees, extending the tax to the whole kingdom, and directing that every landholder and other inhabitant be assessed according to his means, and the tax collected by distress if necessary. When John Hampden refused to pay the tax, and was brought to trial, the judges decided, eight to four, in favor of the crown. One of the early acts of the Long Parliament in 1640 was to declare the ship-money tax illegal and no attempt has since been made to collect ship money in England.

SHIP REGISTRY ACT approved Aug. 18 1914, provided for the admission of foreign-built ships to American registry for foreign trade, and for other purposes. In section 5 of the act entitled "An act to provide for the opening, maintenance, protection and operation of the Panama Canal and the sanitation and government of the Canal Zone," the words "not more than five years old at the time they apply for registry," were repealed. The president of the United States was authorized, whenever in his discretion the needs of foreign commerce may require, to suspend by order, so far and for such length of time as might be desirable, the provisions of law prescribing that all the watch officers of vessels of the United States registered for foreign trade should be citizens of the United States. Under similar conditions the president was also authorized to suspend the provisions of the law requiring survey, inspection and measurement by officers of the United States of foreign-built vessels admitted to American registry under this act.

SHIP RIGGING. The many special terms used to designate the various parts of the standing and running rigging in the days of the sailing vessel are given below:

THE STANDING RIGGING

Bobstay.
Bowsprit-shroud.
Martingale-stay.
Jib-boom guys.
Fore-stays.
Fore-topmast stays.
Inner-jib stay.
Outer-jib stay.
Flying-jib stay.
Fore-royal stay.
Fore-rigging.
Fore-topmast rigging.
Fore-topgallant rigging.
Fore-cap back-stay.
Fore-topmast back-stays.
Fore-topgallant back-stays.
Fore-royal back-stay.
Fore-lift.
Fore-topsail lift.
Fore-topgallant lift.
Fore-royal lift.
Main-stays.
Main-topmast stays.
Main-topgallant stays.
Main-royal stays.
Main-rigging.
Main-topmast rigging.
Main-topgallant rigging.
Main-cap back-stay.
Main-topmast back-stays.
Main-topgallant back-stays.
Main-royal back-stays.
Main-lift.
Main-topsail lift.
Main-topgallant lift.
Main-royal lift.
Mizzen-stays.
Mizzen-topmast stays.
Mizzen-topgallant stay.
Mizzen-royal stay.
Mizzen-rigging.
Mizzen-topmast rigging.
Mizzen-topgallant rigging.
Mizzen-cap back-stay.
Mizzen-topmast back-stays.
Mizzen-topgallant back-stays.
Mizzen-royal back-stays.
Crossjack lift.
Mizzen-topsail lift.
Mizzen-topgallant lift.
Mizzen-royal lift.
Jigger-stays.
Jigger-middle stay.
Jigger-topmast stay.
Jigger-topgallant stay.
Jigger-rigging.
Jigger-topmast rigging.
Jigger-topmast back-stays.
Jigger-topgallant back-stays.

THE RUNNING RIGGING

Fore-tack.
Fore-sheet.
Fore clew-garnet.
Fore-braces.
Fore lower topsail sheet.
Fore lower topsail clew-lines.
Fore lower topsail braces.
Fore upper topsail sheets.
Fore upper topsail clew-lines.
Fore upper topsail braces.
Fore lower topgallant sheet.
Fore lower topgallant clew-lines.
Fore lower topgallant braces.
Fore upper topgallant sheet.
Fore upper topgallant clew-lines.
Fore upper topgallant braces.
Fore-royal sheet.
Fore-royal clew-lines.

SHIPBUILDING INDUSTRY AND CONSTRUCTION. The earliest history of shipbuilding and the development of the sailing ship and steamship will be found under the titles SAILING VESSELS; STEAM VESSELS.

United States.—Dependence on water transportation for trade and travel, both intercolonial and transatlantic, combined with an abundance of timber, the primary raw material of early-day vessels, gave rise to a shipbuilding industry in North America almost concurrently with the founding of the colonies. American shipbuilding got its start at the mouth of the Kennebec River in Maine, where, in 1607, the short-lived Popham colony built and launched the *Virginia,* "a faire pinnace of 30 tons" which made several Atlantic crossings. It was with this vessel that the Popham colonists repatriated themselves to England.

The first decked-over vessel built in America was the *Onrust,* launched at New Amsterdam in 1616. In 1631, the *Blessing of the Bay,* the first vessel built in America for transatlantic trade, was launched at Medford, Massachusetts. Her voyage to New Amsterdam in 1633 opened up a lively trade between the Dutch and British colonists. That launching at Medford was the first of an industry which thrived in Massachusetts for over 200 years.

The most conspicuous advance in early American shipbuilding was Dominie Peter's "great ship" of 300 tons, launched at Salem, Massachusetts, in 1641. This notable vessel exceeded the famous *Mayflower* by 120 tons and set the pace not only for the shipbuilders of the New World, but for the Old World as well, where few vessels so large had been equal to this product of a colony scarcely 20 years old.

Shipbuilding in America became and remained a strong and active industry for over two centuries because its products were good and they could be sold at a lower price than those of other nations. American ships cost less for one all-important reason, namely: the abundant supply of shipbuilding timber available at prices far cheaper than those obtaining in Europe. America presented an untapped supply of fine woods —white oak, live oak, yellow pine, hackmatack, locust, spruce, and tall, straight masting in the form of white pine—at a time when the scarcity of suitable timber in Europe was sorely felt. During the 16th, 17th, and 18th centuries the timber situation in England and on the Continent had gradually deteriorated. By 1700 only an eighth of England's forests remained and by 1800 there was a general timber famine throughout the shipbuilding nations of Europe. Hence, despite being in an initially unfavorable position as regards availability of capital, cheap and skilled labor, sails, cordage, and iron fittings, the American industry forged ahead and undersold the world until steam-engines supplanted sails and iron hulls took the place of wooden.

By 1700 Massachusetts was the scene of a fair amount of shipbuilding activity centered around Newburyport, Boston, Salem, and Plymouth County's North River. William Penn had instituted shipbuilding on the Delaware River in 1682 where it has persisted ever since, but favorable conditions in Holland, combined with a lack of enterprise on the part of the Dutch West India Company, caused the industry to lag at New York, the scene of many later-day triumphs of wooden construction. At the start of the 18th century, the colonial yards were turning out about 4,000 gross tons of shipping per year, most of which were small craft in the 20-to-200-ton range.

By 1676 the ports of Massachusetts had 30 ocean-going vessels of between 100 and 250 tons, besides some 700 smaller craft engaged in the coastwise trade. In 1700 Boston was the home port of 194 seagoing ships, while New York harbored 124. The 40-year period, 1674 to 1714, witnessed the launching of 1,332 vessels of 30 or more register tons each, of which about 240 were sold abroad to foreign owners, mainly English. Colonial American yards were fortunate in having a European market ready and willing to absorb that part of their capacity which the domestic market could not, a situation which was terminated by political developments in Europe shortly after the American Revolution and which, mainly for economic reasons, reoccurred for only a few short-lived intervals up to 1951. However, in 1774, approximately one third of the tonnage in England's merchant fleet was American-built.

While Massachusetts set the pace during the early days of American shipbuilding, there was considerable activity in most of the other colonies. The earl of Sheffield's *Observations on the Commerce of the American States* (London 1783) records that 389 vessels aggregating some 20,000 tons were built in America in 1769; of these Massachusetts accounted for 35 per cent in number and 40 per cent in tonnage. Sheffield's breakdown for 1769 is shown in the following table:

Colony	Number built	Aggregate tonnage	Average tonnage
Massachusetts	137	8,013	60
New Hampshire	45	2,452	55
Connecticut	50	1,542	31
Pennsylvania	22	1,469	67
Rhode Island	39	1,428	37
Maryland	20	1,344	65
Virginia	27	1,269	47
New York	19	955	50
South Carolina	12	789	65
North Carolina	12	607	50
New Jersey	4	83	20
Georgia	2	50	25

By 1775 the annual shipbuilding output of the colonies was approximately 35,000 gross tons.

Before the American Revolution, major vessels of between 50 and 400 gross tons were constructed mainly for the trade between the West Indies and North America and for trade with or sale to Europe. Whaling, in 1775, employed 300 vessels aggregating about 33,000 gross tons. The majority of American-built ships, up to that time were, however, small coastal and fishing vessels.

Unlike World Wars I and II, the American Revolution produced a serious depression in domestic shipbuilding. With the British Navy's harassment of the coastwise and offshore trades and with the English market denied them, the builders' principal outlets were closed. Construction for the Colonial Navy apparently was negligible as delivery of only eight vessels is recorded.

The post-revolution era saw the American builder more dependent on the domestic market for ships than ever before. In 1786 the British applied their navigation laws to the United States. These laws required that ships registered under the British flag be built in the British Empire, thus terminating the English market for American-built vessels, a condition which persisted until the repeal of those laws in 1849. Although an idle gesture in view of the economic advantages of building in American yards at that time, Congress in 1789 passed a registry law which required that American-flag ships be built in the United States. France did likewise in 1793, closing another mart for American ships.

The years between the American Revolution and 1829 were, for the most part, prosperous for shipbuilders in the United States. Backed by favorable legislation such as the Tariff Act of 1789, which caused lower customs duties to be charged for goods imported in American ships than those placed on goods entered from foreign hulls, and favored by construction costs, which at times were 50 per cent lower than those obtaining in Europe, American shipping and shipbuilding went on apace. Aided by discriminatory laws, able to take advantage of the Napoleonic disturbances in Europe, and requiring a much lower capital investment than their European contemporaries, American shipowners were in a fine competitive position, and, consequently, good domestic markets for ships prevailed.

In 1791 Alexander Hamilton, as secretary of the United States Treasury, reported that the American Merchant Marine aggregated 476,274 tons. In 1800 construction amounted to 995 ships having a combined tonnage of 106,000 tons, three times that built in 1775. Despite being set back by the Embargo Act in 1807 and 1808, the yards delivered 147,000 gross tons in 1811. The War of 1812 caused another depression in the shipyards but, in 1815, their production had risen to 156,000 gross tons.

Two events occurred during the post-revolutionary period which proved vital to the industry up to 1951 and seemed likely to continue to do so for the foreseeable future. In 1794 Congress authorized construction of the first six ships (including the famed *Constitution*) for the United States Navy. The navy has continued to be a customer down through the years, its importance as such increasing rapidly between the Civil War and World War II eras. After shipbuilding costs in the United States rose above and became prohibitively higher than those abroad, the compelling reason for the existence of the American industry was its potential contribution to the nation's naval power.

The second event was the enactment of a law in 1817, still in force in 1951, which restricted trade between American ports to ships built in the United States and operated under the American flag. Thus, despite having to charge more than foreign yards in later years, the construction of ships for the United States coastwise, and later its intercoastal and non-contiguous trades, has been limited, with few exceptions, to American yards since 1817. This has been a significant aid in preserving the industry.

The steam engine, a contemporary of England's Industrial Revolution, made its entrance on the commercial shipping stage in 1807 when Robert Fulton placed the *Clermont* in the Hudson River trade. Though its application was American, the engine was built in Britain by the firm of Boulton and Watt. In 1819, an American vessel, the *Savannah,* gained the distinction of being the first steam-engine equipped ship to make an Atlantic crossing. Although unsuccessful financially, the *Savannah* pointed the way to the gradual utilization of steam in ocean-going ships, a factor which swung the construction-cost advantage to England, where the low price of good British engines more than counteracted the high price of British wooden hulls. By 1850, a large wooden steamer could be built in Britain at a price 20 per cent below that for similar construction in the United States.

While steam undermined the competitive advantage of Americans engaged in building for the ocean trades, it proved the foundation of a strong and lively branch of the industry, that which built vessels for the inland river, Great Lakes, Hudson River, Delaware River, and Long Island Sound trades. With foreign hulls excluded by law, these trades created a good market for American builders who catered to them. Though in later years railroad competition virtually killed off the last three, the trades on the Mississippi River System and Great Lakes survived, waxed strong, and were still growing in 1951.

Steam entered the inland-river trades in 1811 when Nicholas Roosevelt, working for the Fulton interests, directed the construction of the *New Orleans* at Pittsburgh. Even at that date the upper Ohio River district was a shipbuilding area. In 1800 the 110-ton sailing ship *Saint Clair* was launched at Marietta, Ohio, and the *Louisiana,* a 300-tonner, has been built at Pittsburgh in 1804. Both of these vessels were destined for the ocean trades, which they joined after sailing to the Gulf of Mexico via the Ohio and Mississippi rivers. It was the advent of steam, however, that spurred the growth of river shipyards to the west and south.

During the period, 1830–1856, American shipbuilders enjoyed a market of increasing activity which reached boom proportions between 1847 and 1855, and began to drop precipitously in 1856. The wooden shipyards were further depressed by the Civil War, but the navy's sudden demand for steam-propelled iron warships caused a small war-born boom in American shipbuilding.

Among the several causes for the good ship markets prior to 1857 were the increasing transatlantic passenger traffic (mainly immigrant); expanding exports of American cotton to England; the discovery of gold in California in 1849 and in Australia in 1851; the reopening of the market for American ships in England, brought about by the repeal of Britain's navigation laws;

and the business boom which preceded the panic of 1857.

Establishment of regular American-flag transatlantic passenger service in 1816 led to the development of the American sailing packets which catered to the rapidly expanding immigrant trade. In 1854, 460,000 people arrived in American ports, more than 18 times the number of arrivals in 1830, and most of this traffic went in American hulls. Large, fast, and well-appointed, the packets offered fine accommodations for first-class passengers, had ample room for a payload of immigrants, and carried high-rate cargoes. Construction of these vessels centered about New York. Reaching sizes of 1,000 tons in 1830, 1,500 in 1849, and 1,700 in 1854, these sailing ships represented some of the best products of contemporary American yards.

"King Cotton" furnished the impetus for a flourishing business in freight-ship construction. Usually smaller and cruder than the packets, freighters made up nearly 50 per cent of the American Merchant Marine in the 1850's. The lion's share of the construction for this market went to the yards in Maine, making that state the center of American shipbuilding.

The famed American clipper ship, designed to meet the needs of the China tea trade in the late 1840's, and refined and exploited in the booming, gold-inspired California trade of the early 1850's, evolved from a combination of the complementary features of the fast, sharp-ended ships produced in the Chesapeake Bay yards for such dubious employments as slave and blockade running, and those of the better transatlantic packets and freighters. The result was a longer, narrower craft with concave underwater lines forward and aft, horizontal keels, and small deadrise and bilge radius midships. To these characteristics were added sail plans noted for their area and height. Ships built in this manner were famous for their speed and seaworthiness, some making the long, arduous voyage from New York to San Francisco via Cape Horn in less than 100 days and the easier return trip in less than 80 days. With favorable winds they could outrun many steamers of the 1940's, some being able to perform in the 16-knot range.

The first true clipper, *Rainbow,* was built at New York in 1845. New York and Boston were the hotbeds of clipper construction. Ranging in size from 1,000 to 2,000 tons in their heyday, they were such financial successes that the freights of their maiden voyages often fully repaid the capital which their owners had invested.

The peak year of the boom, 1855, saw 2,024 vessels aggregating 583,450 gross tons delivered; 4 years later, the figures had fallen to 870 vessels totaling 156,602 gross tons.

Spurred by the mail subsidy acts of 1845 and 1847 about two dozen large wooden paddle-wheel steamships were constructed, notable among them being the Collins Line transatlantic steamers *Arctic, Atlantic, Baltic, Pacific* and *Adriatic,* the latter measuring 4,144 gross tons and costing over a million dollars. Their wooden construction, however, did not measure up to the stresses and strains of ocean-going steam propulsion. The entry of British iron steamers into the transatlantic trade in the 1850's made these craft obsolete and, with the abandonment of the mail subsidies in 1858. construction of such ocean-going wooden steamships in the United States came to a halt,

While American wooden construction was enjoying its heyday, iron shipbuilding in the United States was going through its birth pangs. In 1844, some 22 years after the first iron steamer had been built in Britain, the firm of Betts, Harlan, and Hollingsworth of Wilmington, Delaware, delivered the coastwise steamer, *Bangor,* the first significant iron ship built in America.

Near to sources of domestic iron, the Delaware and Hudson rivers became centers of iron shipbuilding; in 1951 two of America's largest privately owned shipyards, the Philadelphia Naval Shipyard, and several small but active establishments were located on the Delaware; shipbuilding on the Hudson, however, had faded into comparative oblivion.

Up to the Civil War, iron shipbuilding in the United States faired poorly. America lacked the essential tools and skills which were developed for iron construction in Britain and Europe, as well as the driving incentive brought into play by the scarcity of wood abroad. In the 1850's the average annual production of iron ships in America had only reached 1,515 gross tons. The picture changed between the Civil War and World War I.

Inability to compete with Europe in the construction of metal hulls, be they driven by sail or steam, and the low price of American-built wooden sailing vessels, limited the growth of iron shipyards in the United States. Despite several attempts by the federal government to subsidize iron steamship lines, the real impetus for the growth of metal shipbuilding in America, a sizeable market protected from foreign competition, did not come into being until the United States began to build a modern navy. The tide turned when orders for four steel warships, the *Atlanta, Boston, Chicago,* and *Dolphin,* were placed in 1883. Thenceforward the navy was steel shipbuilding's most important customer, the mainstay of its growth and existence.

Wooden construction continued to dominate the American scene until the late 1890's, whereas, in Britain, the annual output of iron and steel tonnage outdistanced wood in the mid-1860's.

Although the markets for high-class wooden hulls—clippers and packets—and for freighters for the cotton trade failed to revive after the Civil War, a new trade, that of shipping grain from the west coast to Europe, caused the construction of wooden sailing vessels to remain an active industry. But it was a specialized industry which found itself concentrated on the Maine coast, close to the best remaining supply of lumber and favored by low wage rates and dawn-to-dusk working hours. Elsewhere wooden shipbuilding declined rapidly. In 1875, Maine launched 80 per cent of the wooden square riggers built in the United States.

Sailing vessels could compete against steam only in the long hauls such as the California grain trade, where speed was unimportant. The wooden ships for such work were much larger than those built in the 1850's. In the 1870's square riggers of 2,000 gross tons were common and in the 1880's 3,000 tonners were built. Far larger than the clippers and carrying less sail, these ships could handle bigger cargoes and be manned by smaller crews. They were economically competitive with European sailing ships up to the 1870's, when the cost of British sailing vessels built of iron finally fell to their level. Between 1860 and 1880 British yards turned out

SHIPBUILDING INDUSTRY AND CONSTRUCTION

Marine Engineering and Shipping Review

Marine engineers working in the mold loft of a large shipyard, where the lines of the ship are drawn in full size on the floor, from which are developed wood and paper templates of the hull's structural members.

Above left: A plate fabricating shop, where the steel plates are laid out in accordance with the templates and cut to shape. A machine-driven plate-cutting torch is shown in the foreground.

Above right; The building berth is readied for construction and the keel plate is laid in position.

Right: The ship's bottom plating is laid into position.

more iron sailers than were built of wood during that period in the United States. The upshot was an oversupply of sailing ships competing for the world markets which caused a rapid decline in freight rates and, consequently, a drastic drop in the demand for American-built wooden square riggers. By 1880 the market for Maine-built square riggers had collapsed and it never really recovered. Whereas, in the period 1870–79, 625,000 gross tons of wooden square riggers had been built in the United States, the output for the period 1880–89 dropped to 200,000 tons. The last of the breed was *Aryan,* launched on the Kennebec in 1894. The plight of the American yards specializing in wooden construction was further aggravated in the 1880's when British yards began in earnest to build sailing vessels of steel. Cheaper, lighter, and stronger than their iron contemporaries, they proved unsurmountable competition for the American ships of wood.

The construction of metal sailing craft in the United States never gained more than a toehold. American metal sailing-ship costs precluded competition in the unprotected world ship markets and the comparatively low cost of American-built wooden sailers prevented their entry into the protected field created by the coastwise trades. Hence, in the latter part of the 19th century American shipbuilding was divided into two distinct branches, namely: that of building wooden sailers and that of building metal steamers. So different were the requirements of capital investment, managerial ability and skill that very few of the wood yards bridged the gap to metal construction. The remainder went under after the last boom in wooden building, that involving the construction of wooden schooners for the protected coastwise trades.

The wooden schooner grew in size from a three master of less than 400 tons, built in 1865 to a six master of 3,730 gross tons built in 1910. Far easier to handle and requiring much smaller crews than the square riggers, they were ideal for handling bulky cargoes in the coasting trades. They filled the gap caused by the collapse of the square rigger market and enjoyed boom times, the first in the period 1900–1905 and the second in the era of World War I. After that the business of building wooden sailing craft for commerce died out.

Iron shipbuilding gained stature very slowly after the Civil War. The spurt of naval orders inspired by the *Monitor-Merrimac* engagement of 1862 died out with the peace and until the orders of 1883 metal construction for the navy was almost dormant. Between 1866 and 1884 only 10 iron vessels, all comparatively small, were delivered under naval contracts.

The American Steamship Company, founded in 1871, placed orders with William Cramp & Sons Ship & Engine Building Company, Philadelphia, for four iron passenger steamships, the first large American-built craft of this type destined for the transatlantic trade. Some 340 feet long, measuring 3,100 gross tons, and fitted with a screw propeller driven by a compound steam engine of 2,000 indicated horsepower, the *Pennsylvania,* the first of the group, entered service in 1873.

Spurred by the subsidy act of 1872, the Pacific Mail Steamship Company, which operated between New York and the Orient via Panama and San Francisco, contracted with John Roach's Delaware River Iron Shipbuilding and Engine Company, Chester, Pennsylvania, for two iron steamers, *City of Peking* and *City of Tokyo.* Delivered in 1874, they were then the largest vessels built in America; their twin compound engines drove them at 15 knots.

Despite such advances, the American iron shipbuilders' average annual output for the 1870's was only about 18,700 gross tons.

The navy, as heretofore mentioned, came to life in the 1880's. Between 1885 and 1897, some 56 sizeable warships, mainly built of steel, were delivered. This fleet had a displacement tonnage of about 183,000 and contained machinery totaling 312,000 horsepower. Costing over $53,000,000, it was the spur which brought about modernization of American metal shipyards. Included in this group were the 10,000-ton battleships *Indiana, Massachusetts,* and *Oregon;* the latter, built by the Union Iron Works at San Francisco and delivered in 1893, is famous for her exploits in the Spanish-American War.

The high-point of pre-1900 merchant shipbuilding was the construction of two first-class transatlantic liners, *Saint Louis* and *Saint Paul,* for the International Navigation Company. Delivered by the Cramp Yard in 1894 and 1895, respectively, they were 535 feet 8 inches long. Propelled by twin screws, each driven by a 10,250-horsepower quadruple-expansion steam engine (giving each vessel a total of 20,500 horsepower), these ships could make 20 knots. Each vessel measured 10,700 gross tons and displaced 15,600 tons at its load waterline.

In the years 1890–1899 annual average output of merchant vessels in America, wood and metal, was 225,732 gross tons, that of metal vessels, including steamers, wind ships and barges, was 86,434 gross tons, and that of metal steamers, 72,782 gross tons. In the same period, annual output of steel naval craft averaged 22,114 displacement tons, 24,259 being built in 1899. Of the average of 72,782 gross tons of metal merchant steamers turned out annually during the period 1890–1899, only some 29,300 were built by the seaboard yards which had to face foreign competition. During the same years the average annual output of comparable metal ships in Britain was over 33 times as great.

In the 1890's and early 1900's the character of American metal shipyards underwent a fundamental change. Spurred by an act passed in 1886, which required that only domestically manufactured components could be used in American warships, new yards, with the requisite tools to accomplish this end, were formed. Requiring formidable sums to create them, the new yards took on the form of corporate enterprises and drew their capital from sources outside the shipbuilding industry. Primarily armament plants, formed to build warships for the United States Navy, they were much larger, employed more men, and were far more scientifically laid out than the largest American metal shipyards of the 1880's. For example, whereas a first-class metal yard in the early 1880's could be created for less than $100,000, the Newport News Shipbuilding and Dry Dock Company, formed in 1890, at Newport News, Va., represented, in 1894, an investment of $3,500,000, covered 82 acres of land, and had a half-mile frontage on the James River. Comparable yards brought into existence near the turn of the century were the Fore River Ship and Engine Company at Quincy, Mass., and the New York Shipbuilding Company, at Camden,

New Jersey. These yards became and remained, as of 1951, major contributors to America's naval power and merchant fleet, the names of the latter two having been changed to Bethlehem Steel Company, Shipbuilding Division, Quincy Yard, and New York Shipbuilding Corporation, respectively.

Despite vastly improved facilities, and the manner in which naval orders supported the inherent high overhead of same, American yards in the early 1900's, as in the post World War II era, could not compete with foreign yards in the world market for merchant tonnage. High wages, the high cost of steel, and inability to specialize on certain types, due to lack of volume, caused American prices to range from 30 to 50 per cent higher than British in 1905. In the years 1900 to 1913 average annual output of metal merchant tonnage in the United States was 248,225 gross tons, 231,662 being produced in 1913. The navy kept the seaboard yards going during this period by taking delivery of a fleet of 157 vessels displacing 878,108 tons, for which it paid the yards $198,500,000. In this respect it is interesting to note that the 60,000-ton aircraft carrier ordered from the Newport News Shipbuilding and Dry Dock Company in 1951 had an estimated price of $218,000,000. Only in the protected coastwise, Great Lakes, and inland-river trades could American yards find customers for merchant tonnage. Great Lakes tonnage accounted for nearly 40 per cent of all American merchant construction during these years.

Since American shipowners simply could not afford to buy American-built ships and expect to compete with foreign contemporaries, at the end of 1913 only 10 per cent of American trade was carried in vessels flying the Stars and Stripes.

World War I had scarcely started when America's dearth of ocean-going tonnage made itself felt. The merchant fleets of Britain and France were engaged in waging the war and Germany's ships were bottled up. American exports piled up on the seaboard, necessary imports failed to arrive, freight and charter rates soared, and prices of ships went up 400 and 500 per cent. Unable to get deliveries due to the tremendous backlog in European yards, foreign owners began to order ships in America; American owners did likewise.

With the country's foreign trade paralyzed by the ship shortage, a concerned Congress passed the Shipping Act of 1916, signed on September 7 of that year. The act created the United States Shipping Board, which was empowered to form a $50,000,000 corporation to build, buy, hire, operate, and maintain an ocean-going merchant fleet and to regulate American shipping.

On April 16, 1917, ten days after the United States entered the war, the Emergency Fleet Corporation was organized, its duty being to provide the largest possible merchant tonnage in the shortest possible time. The corporation embarked on a shipbuilding program larger than the world had ever known. By the time the United States entered the war there was considerable activity in the existing yards; 431 steel merchant vessels, totaling 3,068,431 deadweight tons, were under construction on July 11, 1917, the day the president requisitioned all steel merchantmen.

The corporation began its labors by taking over a number of the existing yards and entering upon the construction of new ones. The new yards were primarily ship-assembly plants, components being obtained from other industries capable of fabricating them. The larger old-line firms confined their efforts to far more complicated tasks of naval construction, their main reason for existence.

In the ensuing years, America proved beyond doubt that it was technologically equipped to build steel ships in quantity. The following table includes all the vessels completed and delivered to the Emergency Fleet Corporation, from America's entry in the war until the program ended in 1922, including the 431 requisitioned in 1917:

VESSELS CONSTRUCTED BY EMERGENCY FLEET CORPORATION

(Includes all vessels of 5 gross tons and over)

	Number	Dead Weight	Approximate Gross
Steel Vessels			
Passenger and cargo	25	308,972	298,798
Transport	22	179,775	166,210
Cargo	1,420 *	9,509,234	6,339,489
Refrigerator	19	161,400	107,600
Collier	9	70,350	46,900
Tanker	138	1,363,030	908,687
Tug (ocean)	46	**	**
Tug (harbor)	8	**	**
Barge	6	22,456	22,200
Wood Vessels			
Cargo	304	1,120,600	747,567
Tanker	1	4,700	3,134
Sailing vessel	10	34,500	22,650
Barge	86	277,000	277,000
Finished hull	115	447,700	447,700
Tug	77	**	**
Concrete Vessels			
Cargo	4	13,500	9,000
Tanker	8	60,000	40,000
Composite Vessels			
Cargo	18	63,750	42,000
Total	2,316	13,636,967	9,478,935

* Includes 30 vessels built in Japan and 4 in China.
** No deadweight can be shown for these tugs.

In 1918 America delivered 3,025,806 deadweight tons, while Britain's war-swollen yards put out 2,500,000, the first time since the halcyon 1850's that new American tonnage had outpaced British. In the peak year of 1919, 6,384,423 deadweight tons left American yards.

The 430 naval vessels produced in the seven years, 1916–1922, totaled 983,392 displacement tons, 155,642 tons coming out in 1918 and 221,255 tons in 1919.

Although containing a few bright spots, the years 1923 to 1935, inclusive, were generally miserable for shipbuilding in America. On the one hand there was the tremendous war-born merchant fleet, capable of supplying more tonnage than American owners could absorb, even when sold at bargain prices; on the other was foreign competition, which could build comparable units for 30 to 60 per cent less. Added to these depressing factors, was America's signature to the agreements of the Reduction in Armament Conference of 1922, which caused cancellation of contracts for seven United States battleships and four battle cruisers. The emergency yards, lacking versatility, swiftly closed; the old-line firms, with their overhead situations aggravated by the curtailment of naval work, grasped at every straw to keep going. Battleship yards contracted for trawlers, ferryboats, railway cars, and hydraulic turbines.

Two Merchant Marine acts, those of 1920 and 1928, contained provision to encourage merchant construction. The inducements of the 1920 act were quite inadequate; only 15 vessels aggre-

gating 101,511 gross tons were inspired by its construction-loan provisions up to and including 1928. The 1928 act, which provided mail contracts and more liberal construction loans for vessels engaged in foreign trade, produced better results. By 1933, 31 combination passenger-and-cargo ships, 9 tankers, and 2 seatrains, aggregating 446,875 gross tons, were completed under the act's provisions. By then, the general depression of the 1930's was in full swing and shipbuilding faced heavy going. In 1934, there were only two oceangoing ships delivered, tankers which aggregated 9,544 gross tons. Total production of American merchant craft in that year was 66,649 gross tons. The years 1923 to 1935, inclusive, witnessed an average annual American output of 213,080 gross tons of all classifications of merchant craft, and 35,040 displacement tons of naval craft, about 56 per cent of the 1900–1913 average yearly naval output.

The provisions of the 1928 act failed to induce construction of dry-cargo ships, and the mail subsidies produced undesirable, if not scandalous, conditions. The Congressional investigations of 1935 resulted in a thorough overhaul of American policy for shipping subsidies, enacted into law as the Merchant Marine Act of 1936. Briefly, it provided for two types of subsidies, construction and operating. American owners meeting the conditions stipulated are paid the difference between their operating costs and those of their foreign competitors, the subsidy being subject to recapture to the extent that profits exceed 10 per cent, and the difference between foreign and American construction costs for comparable ships are paid by the government, provided foreign costs are not more than 50 per cent cheaper than American.

The act created the Maritime Commission to carry out its provisions and empowered the commission to build ships for its own account, which could be sold, chartered, or operated by that agency.

The difficulties inherent in these provisions are accurate determination of foreign construction and operating costs, as well as the capital investment on which the American owner's profits are to be calculated. Fifteen years after passage of the act, these problems lacked satisfactory solutions. Comparability of ships is difficult to establish.

Empowered to do so by the act, the Maritime Commission embarked on a long-range construction program in 1938 by placing orders for 50 high-grade freighters. The plan, then, was to build 50 ships a year for 10 years. With the outbreak of World War II, in 1939, the sights were raised to 150 per year, and, by August, 1940 to 200. Congress, in April, 1941, authorized the commission to order 100 more of these high-grade vessels.

Hard pressed by losses inflicted by German submarines, Britain, in December, 1940, placed an order for sixty freighters in America, to be constructed in two new yards especially organized and built for this program. A modified version of these vessels was designed shortly thereafter, which became known as the Liberty ship. As part of the emergency shipbuilding program announced by President Roosevelt on January 3, 1941, some 332 Liberty ships were ordered by September 12 of that year. These ships were laid down in new yards designed to turn them out in quantity. The first Liberty ship was delivered on December 30, and the second on December 31, 1941.

While the World War II shipbuilding program resembled that of World War I, it was carried out on a much larger scale. An important difference, however, was centralization of design; instead of permitting each yard to build to its own plans, the same set of drawings was followed by all the emergency plants. An industry with a scant thirty-eight yards, equipped with 120 ways, 300 feet long or longer, in 1939, was bolstered to 84 yards with 614 building berths employing 1,700,000 men and women by 1944. Merchant-type construction rose from 426,533 gross tons in 1940 to 10,142,776 in 1944. The following table shows that 5,777 ships aggregating 39,921,000 gross tons were built for the Maritime Commission alone in the years 1939–1945:

VESSELS DELIVERED UNDER THE UNITED STATES MARITIME COMMISSION SHIPBUILDING PROGRAM, 1939–1945, INCLUSIVE

Summary, by types	Number built	Deadweight tonnage	Gross tonnage
A. Major types			
1. *Dry cargo*			
a. Standard cargo	541	5,349,000	3,834,000
b. Emergency cargo	2,708	29,182,000	19,447,000
c. Victory cargo	414	4,492,000	3,151,000
2. *Tankers*			
a. Standard tankers	643	10,695,000	6,613,000
b. Emergency tankers	62	670,000	448,000
B. Minor types			
1. Coastal and concrete cargo	360	1,558,000	1,183,000
2. Coastal and inland tankers	64	214,000	151,000
3. Ore carriers	21	344,000	196,000
4. Concrete barges	80	368,000	338,000
5. Wooden barges	41	87,000	52,000
6. Harbor tugs	75	*	18,000
7. Seagoing tugs	49	*	41,000
8. Other minor types	37	30,000	1,000
C. Military types			
1. Cargo attack ships (Navy AKA)	93	534,000	649,000
2. Tankers			
a. Oilers (Navy AO)	36	624,000	391,000
b. Gasoline coastal tankers (AOG)	36	63,000	47,000
3. Transports			
a. Transport attack ships (Navy APA)	178	864,000	1,321,000
b. Hospital transports (APH)	3	11,000	25,000
c. Troop transports	92	700,000	1,168,000
d. British transports	13	34,000	89,000
4. Other military types			
a. Tenders	2	15,000	16,000
b. Escort aircraft carriers	58	191,000	567,000
c. Tank landing ships (Navy LST)	75	171,000	36,000
d. Frigates (Navy PF)	96	96,000	139,000
Totals	5,777	56,292,000	39,921,000

* No deadweight tonnage for tugs.

Source: *A Statistical Summary of Shipbuilding Under the U.S. Maritime Commission During World War II.*

In the years, 1940–1945, inclusive, 1,556 combatant vessels and large auxiliaries were built for the navy; total displacement tonnage for this fleet was 4,663,026. Add to that 4,099 naval landing craft, 3,444 small auxiliaries, 324 ships for the Coast Guard, and 12,795 small vessels for the army to gain an inkling of the staggering accomplishments of wartime shipbuilding. With the aid and guidance of the small nucleus of shipbuilders employed in the prewar yards, complete strangers to the industry devoted their energies to shipbuilding with remarkable success. As in World War I, the larger old-line firms worked in comparative secrecy building America's

mighty two-ocean navy, while the prodigious but comparatively simpler efforts of the emergency yards, which built the Liberty and Victory ships, received widespread notice in the press.

For shipbuilding, the aftermath of World War II was quite similar to its predecessor. The emergency yards closed down swiftly and the old-line firms pulled in their belts. With few exceptions, the existing, war-built, high-class standard dry-cargo ships and tankers met the needs of shipowners. Up to August, 1951, only one post-war dry-cargo ship had been delivered by an American yard. An increase in the world's consumption of petroleum started a tanker-building boom in late 1947, which temporarily buoyed the industry, but before the start of the Korean War in June 1950, its effects had worn off and the big yards were hard pressed for work. Three important passenger vessels were laid down in the postwar era, namely the American Export Line's 682½-foot *Independence* and *Constitution,* and the United States Lines' 980-foot superliner *United States,* the former two being delivered and the latter launched in 1951.

The international tension accompanying the Korean War brought into play an all too familiar situation in shipbuilding. Expansion of the steel industry to meet the threat of war caused a demand for new ore carriers which soon filled all available ways on the Great Lakes. The oil thirst of a world on the brink of war led to new tanker orders, defense needs stepped up building on the inland rivers, and by September, 1951, the Federal Maritime Administration, successor to the Maritime Commission, had ordered thirty-five high-speed dry cargo ships of the Mariner class. Expected to cost about $9,000,000 each, making them the most expensive dry-cargo ships ever ordered, these vessels were conceived with the thought that their 22-knot top speed would enable them to run away from modern submarines. Important orders for building and converting naval craft were announced in the summer of 1951 and, once again, American shipbuilding faced a hectic feast which could, to some extent at least, have been avoided by a national policy of building ships at a comfortable pace during the peacetime or "famine" years. On Jan. 1, 1951, there were on order 32 large merchant vessels totaling 391,688 gross tons; by September 1 of that year, the threat of war had swollen the total to 88 merchant ships with an aggregate gross tonnage of 1,087,416.

SHIP CONSTRUCTION

Before a shipbuilding contract is signed, the prospective owner and builder will have arrived at an agreement regarding the general dimensions, characteristics, and appearance of the vessel. This agreement is embodied in a set of documents known as the contract plans and specifications. Not to be confused with the numerous working drawings which must be produced during the course of construction, the contract plans (usually ten to twenty in number) show the general arrangement, scantlings (sizes of structural members) and principal dimensions of the vessel, while the specifications describe quite thoroughly the details of hull construction, machinery installation and outfit which are not amenable to delineations on the contract plans.

Contract plans and specifications for ocean-going ships come from one or two sources. The prospective owner may engage an independent naval architect to develop a set describing the vessel which will meet his needs, and then ask one or more shipyards to submit bids based on same, or he may describe his needs to a shipyard and ask the yard to submit contract plans and specifications to serve as a basis for negotiations.

Hence, before the contract is signed the basic design of the ship which will meet the prospective owner's requirements as to cargo-carrying capacity, speed, cruising range, fuel economy and the like has been worked out, and the shipbuilder has prepared a price estimate and set a date of delivery based on the contract plans and specifications.

Establishment of the delivery date required formulation of a tentative master schedule of construction events. Upon the signing of the contract, the master schedule is placed into effect and expanded as to details. A schedule for the production of detailed working drawings is established, based on the sequence in which the several sections of the ship's structure will be built. As rapidly as plan production permits, materials are ordered to be delivered in time to permit construction to proceed in accordance with schedule.

As soon as the line drawing (the drawing which describes the shape of the hull) is completed, the mold loft commences to reproduce it in full size on the mold loft floor. With the aid of this full-size delineation, and the structural working drawings produced in the drafting room, wood or paper templates outlining the shape of the plates and frames which will form the hull are developed by the loftsmen and sent to the steel-fabricating shops. The geometry of the ship is the mold loft's province, and making flat templates of the warped surfaces involved in a ship's plating requires painstaking care and a very practical knowledge of geometry.

While the loft work is in progress the building berth is prepared so that, when the keel-laying date occurs, all will be in readiness to begin assembly of the fabricated keel and bottom plating as it arrives from the shops.

In the fabricating shops the outlines of the templates are transferred to the plates, after which they are cut by torch or shears, rivet holes punched out as required, and bent to shape. In a modern welded-hull, very little riveting is required, hence, the amount of hole punching for some present-day vessels is negligible.

Some plates and most frames must be heated in a furnace so that they may be bent to the shapes required. So called "furnace plates" are avoided where practicable because they are expensive to fabricate. It is fascinating to watch the work on the bending slabs where the glowing frames and plates are bent precisely to the forms dictated by the mold loft. Here, steel templates are required, since, if made of wood, they would go up in flames upon contact with the hot steel to be bent.

It often proves economical to sub-assemble certain structural sections on welding platens and to deliver the sub-assembly, substantially complete, for erection on the ship as a unit.

The introduction of hand and, later, machine welding to the shipbuilding process in the 1930's made increased use of sub-assembly practice desirable from both an economic and technological viewpoint. Widespread employment of heavy-lift cranes, which enable the yards to handle larger sections, has permitted further exploitation of the economies of sub-assembly.

Although installation of machinery after launching is still common, up-to-date practice requires installation prior to the launch. Hence, orders for boilers, condensers, turbines, gears, shafting, and propellers, along with auxiliaries, are placed early in the shipbuilding process so that they will be available when the hull is ready to receive them. While the larger yards are equipped to build their own machinery, it often happens that such equipment is ordered from other firms specializing in certain items. In fact, the modern tendency, with certain notable exceptions, is for shipyards to become builders of hulls and installers, rather than manufacturers, of machinery and outfit components.

As the structural components and sub-assemblies are brought to the building berth, they are erected in position and welded or riveted to the adjoining structure. The keel and bottom plating is followed by the floors (vertical bottom framing made of plate) and inner-bottom plating. Bulkheads, usually in the form of sub-assemblies erected as a unit, follow, and then the side frames and plating. If machinery is to be installed prior to launching, the erection of engine room structure above the inner bottom may be held up until the major units are fastened to their foundations and, then, that section of the ship's hull is erected around them.

As the structure of a compartment is completed, it is tested for water tightness. Completion of tightness tests signifies that a compartment is ready for outfitting at which time pipe fitters, electricians, and other mechanics accomplish their work, all in accordance with schedules set up to prevent one trade from interfering with another.

When all the work scheduled to be completed on the building berth has been accomplished, the ship is ready for launching. Usually this stage finds the vessel decked over with superstructure partially installed and machinery installation nearly complete, but with much outfitting work remaining. There are three methods of moving the ship from dry land to water, namely: end launching, side launching, or floating. End launching, the most common, and, also, the most complicated method, sees the ship slide stern first into the water. This is accomplished by erecting a set of inclined parallel timber tracks, known as a standing ways, beneath the vessel. These extend out into the water far enough for the ship to be completely waterborne before the fore poppet passes over the way ends. Several coats of hard and soft greases are applied to the top of the standing ways; then a set of skids, known as sliding ways, are placed on the grease, on top of which, and at right angles to them, are placed hard-wood wedges at close intervals. Between these wedges and the hull of the ship a cradle is constructed. Towards the stem and stern, where the vessel narrows down, the cradle builds up and slants inward to maintain contact with the hull. The forward end of the cradle is a complex structure. Known as the fore poppet, it bears the whole non-waterborne weight of the ship when, near the end of the launching, the stern's buoyancy causes it to rise upwards and leave the standing ways. Besides being strong, it acts as the pivot about which the ship rises as it enters the water.

Usually on the night before the launching, the work of transferring the weight of the ship from the keel blocks and shores, which supported it during construction, to the launching cradle is begun. This is accomplished by driving in the wedges between the cradle and sliding ways with sledge hammers until the cradle lifts the ship off the blocks and shores. The sliding ways are shored to prevent the ship from moving before the appointed time.

At the time the ship is to be launched, usually at the peak of high tide, which affords the maximum depth of water over the way ends, a trigger mechanism is actuated to release the last restraint on the sliding ways and the force of gravity causes ship, cradle, and sliding ways to slip down the inclined standing ways into the water. The successful end launching of a large ship is a masterpiece of engineering, requiring consideration of a multitude of details and coordination of effort which few laymen appreciate.

Side launchings, common on waterways which are too narrow to permit end launchings, while more spectacular, are apparently just as safe, if not safer, than end launchings. Here the ship lies at right angles to the ways, of which there may be eight or ten, and slides sideways into the water. On the Great Lakes, ships over 600 feet long have been side launched into graving dry docks less than twice as wide as the vessel's maximum beam.

Floating, from a technological viewpoint, is, by far, the most preferable manner of launching, but requires a formidable capital investment to create the necessary building basin or wet dock. Here the ship is built in a type of graving dry dock called a building basin. The floor of the basin is below the level of the sea and the basin is shut off from the water by a caisson. When the ship is ready to be "launched," water is admitted into the basin, the ship floats, the caisson is floated and removed from the basin's entrance, and the ship towed out and brought to an outfitting dock. The largest ship built in America, the 980-foot *United States,* was floated from a building basin in 1951. The building basin presents the added advantage of permitting the ship to be built on a level platform rather than on an incline, which is a necessary evil associated with end launchings.

After the launch the ship is moved to an outfitting dock where the superstructure is completed and the myriad items which make up the vessel's outfit are installed. The outfitting pier usually is equipped with a heavy-lift crane which can handle anything which did not go into the ship prior to launching. This may merely be a comparatively light set of stacks and masts, but, on the other hand, it might be 16-inch-gun turrets for a battleship. On the whole, however, the outfit consists of a multitude of comparatively small items which must go into place in proper sequence. The liner *Independence,* launched early in June of 1950, required seven months at the outfitting dock, even though her machinery was installed prior to launching.

The completed vessel is subjected to dock trials and sea trials. When undergoing dock trials, the ship's machinery is turned over with the vessel tied to a pier. Once satisfied that all is in working order, the ship is taken out for sea trials which may simply consist of an 8-hour run at rated power. Important vessels undergo more complex trials to furnish data on speed and fuel consumption at several power outputs, as well as to determine maneuvering characteristics.

Satisfactory completion of trials is followed by delivery to the owner. A large ship is the

most complex product of modern industry. Were a modern passenger liner to serve merely as a floating hotel its construction would be a formidable undertaking. But all its components must withstand the ravages of the sea, the corrosive action of salt-laden air, the buffetting of wind and water unabated.

High standards are commonplace in the construction of ships and marine machinery The shipbuilder's work, from drawings to final product, are subject to rigid inspection from three and often four or five separate sources namely: the prospective owner, the classification society, and one or more governmental agencies. The owner, who naturally wants his ship to be built in accordance with specification, may employ his own inspectors; he, also, in most instances, will engage a classification society to class his ship. The classification society is a private non-profit organization which certifies to insurance underwriters that the ship is built to meet the rigors of the service for which it is intended. It has a body of rules for the construction of hull and machinery, based on engineering theory and accumulated experience. Starting off with inspection of drawings, it determines that the plans are drawn up in accordance with the rules and, then, inspects the ship as it is built to ascertain that the structure and materials are as called for by the drawings. Several governmental agencies, notably the U.S. Coast Guard, inspect parts of the hull and machinery to see that they meet the requirements of laws passed to safeguard the lives of passengers and crew. Hence a wealth of knowledge and experience far greater than any individual firm could afford to assemble is devoted to ascertaining that the shipbuilder's product is seaworthy.

Aside from the number of skills which are employed in designing a ship and in fabricating its components, there is the all-encompassing task of the shipyard's production-control department, which prepares the building schedules. Each part must be assembled into the whole in proper sequence and in accordance with schedule. Simple to state, the sheer mass of detail involved makes planning and scheduling a complex proposition requiring much experience.

JAMES E. GORDON,
Associate Editor, Marine Engineering Review.

SHIPIBO, shē-pē'bō, South American Indian tribe of Panoan stock, living in the forested regions of the upper Ucayali River, Peru. Their existence was reported by Franciscan missionaries who visited them in 1651, but a mission established for them in 1764 was, after a brief period of success, massacred in 1767, and the Shipibos have since rarely come in contact with the whites. They are great wanderers with no fixed places of migration, and are skilled boatmen and fishermen.

SHIPKA PASS, Balkan Peninsula, extends between Bulgaria and the territory formerly known as Eastern Rumelia, since 1885 incorporated with Bulgaria, at a height of 4,600 feet above sea-level, and is 87 miles distant from Rustchuk and 50 miles northeast of Philippopolis. In the hot fight between the Russians and Turks, 1877, the Russians held the position and Suleiman Pasha lost 20,000 men in his attempt to take Fort Nicholas, on the summit of the pass, Aug. 21-26 and Sept. 9-17, 1877.

SHIPLEY, town, England, of Yorkshire (West Riding), lies three miles north-northwest of Bradford, on the river Aire. The large parish church of St. Paul is a fine modern Gothic specimen. The principal industry is the manufacture of woolens and cloths, and the quarrying of stone. Pop. (1948 est.) 32,600.

SHIPPEN, William, American surgeon: b. Philadelphia, Pa., Oct. 16, 1736; d. Germantown, Pa., July 11, 1808. He was graduated at Princeton in 1754, took his M.D. at the University of Edinburgh in 1761 and engaged in practice at Philadelphia in 1762. He began the first series of lectures on anatomy given in America, at Philadelphia, in 1762, and in 1765 became professor of anatomy and surgery at the newly-established medical school at the College of Philadelphia; from 1780 until he retired in 1806 he was professor of anatomy, surgery and obstetrics at the University of Pennsylvania. In 1777–1781 he was director general of the military hospitals of the United States.

SHIPPENSBURG, borough, Pennsylvania, in Cumberland County; altitude 649 feet; 11 miles northeast of Chambersburg; on the Pennsylvania; Western Maryland; and Reading railroads. The borough is situated in a grain-producing area; there are manufacturers of clothing, furniture, paper novelties, and flour. Shippensburg was founded in 1730 by Edward Shippen. It is the seat of a state teachers college. Pop. (1940) 5,244; (1950) 5,710.

SHIPPIGAN, shĭp-ĭ-găn', seaport town, Province of New Brunswick, Canada, in Gloucester County, at the southeastern entrance to Chaleur Bay, opposite Shippigan Island, 70 miles east of Bathurst. It is a terminus of the Inter-Canadian National Railway system, and has steam ferry communication with St. George's Bay, Newfoundland. It has a fine harbor, a maritime trade and valuable fisheries. Beyond Shippigan Island, Miscou Island is frequented by sportsmen for plover, the best in Canada.

SHIPPING AND SHIPBUILDING TERMS. The more common terms used in shipbuilding have been gathered here for the convenience of the student who wishes to read the articles on ship and shipbuilding.

Abaft.—Behind, at the rear, as abaft the beam, that is somewhat within a semi-circle to the rear of a vessel's midship beam. See BEAM in this article.

Aft.—At, near or toward the stern of a vessel. Also AFTER.

After Peak.—The aftermost tank or compartment immediately forward the stern post.

After Perpendicular.—A line perpendicular to the base

line at the after edge of the stern post or center of rudder stock. It shall not be further forward of the after end of the summer draft waterline than 4% of the length of that waterline. See also FORWARD PERPENDICULAR.

Amidships.—In the vicinity of the middle portion of a vessel as distinguished from her ends. The term is commonly used to convey the idea of general locality. Technically it is a definite location midway between the forward and after perpendiculars.

Anchor.—A heavy steel or iron instrument, attached by a chain or hawser to the bow or stern of a vessel, for dropping to the bottom and holding a ship that is not tied to a dock. It usually has a ring or shackle in the head, a longitudinal shank, and a cross arm ending in flukes (hooks designed to catch in the sea bottom). Occasionally both bow and stern anchors are used.

Athwartships.—Across the ship, at right angles to the keel.

Ballast.—Any weight or weights, as sea water, concrete, pig iron, etc., placed in the lower part of a vessel to help keep her upright. A vessel without cargo usually requires ballast to give sufficient draft to be seaworthy in bad weather and occasionally to prevent her being topheavy.

Bark.—A three or four masted vessel square rigged except on the aftermost mast which is fore and aft rigged.

Barkentine.—A three masted vessel square rigged on the foremast and fore and aft rigged on the main and mizzen masts.

Beam.—An athwartship member supporting a portion of a deck; also the width of a ship; also a straight steel framing member as an I-beam.

Belay.—To make a rope fast by turning it around a cleat or bitt or removable pin (the latter called a belaying pin).

Below.—Any part of a ship below a deck; the equivalent of the landman's "downstairs."

Berth.—A bunk or bed as for a sailor; also a place for a ship to lie.

Bilge.—The rounded portion of a ship's hull, between the side and the bottom.

Bilge Keel.—A fin fitted to the hull on each side of a ship at the turn of the bilge to reduce rolling.

Bitt.—A pair of posts, usually combined in a heavy steel casting, attached to the weather deck of a vessel or on piers or wharves for securing the mooring lines or hawsers, as towing bitt, or mooring bitt. More specifically called bollards when attached to piers or wharves.

Block.—A mechanical contrivance having one or more grooved pulleys mounted in the casing or block usually fitted with a hook shackle or ring by which it may be attached. A device commonly used for making a turn in hoisting ropes, and increasing leverage by means of and according to the number of pulleys used.

Bobstay.—A stay holding the bowsprit down to the stem.

Boom.—A long, heavy spar, pivoted at the lower end, as for hoisting cargo, or holding the foot of a fore-and-aft sail.

Boss.—An enlargement or curved swelling portion of a ship's hull at the point where a propeller shaft passes through.

Bow.—The forward part of a ship, also called the bows.

Bridge.—A high transverse platform, often forming the top of a bridge house, extending from side to side of the ship and from which a good view of the weather deck and the sea may be had. An enclosed space called the pilot house is erected on the bridge in which are installed the navigating instruments such as the compass and binnacle, the control for the steering apparatus, and the signals to the engine room. The term is also applied to the narrow elevated walkways, called connecting bridges, which connect the bridge deck with the poop and forecastle decks. This type of bridge is usually found on tankers for convenience in heavy weather.

Brig.—A two-masted vessel, square rigged on both masts; also a jail.

Brigantine.—A two-masted vessel square rigged on the foremast and fore and aft rigged on the main mast.

Bulkhead.—One of the various vertical partitions in a ship's hull, either fore and aft or athwartships.

Bulwark.—The raised side of a ship above the weather deck, topped by a rail.

Bunker.—A compartment low down in the hull for carrying coal or other fuel.

Buoyancy.—Ability to float; also the resulting upward pressure of water on a floating body.

Calking.—Making tight a seam between planks, as by filling with oakum, hence tightening up any joint so as to be water-tight; or closing a seam in a vessel with oakum and a chisel. Steel plating is calked with a pneumatic hammer peening and driving the material together until water- or oiltight at the joints.

Camber.—A slight upward bend; the upward curvature of a deck by which it is higher at the centerline than at the deck side to facilitate drainage of water from the deck.

Cant.—Something set at a slope or angle, as the cant frames—sloping deck beams where a vessel's body narrows toward the stern (and sometimes the bow).

Capstan.—An upright (vertical shaft) windlass adapted to heaving in lines.

Carline.—Any short fore and aft timber for connecting beams, or the like, as a mast carline, abutting against a mast or at a deck opening.

Center Line.—The fore and aft middle line of a vessel from stem to stern.

Centerboard.—A vertical board or plate pivoting to swing in a well extending through a boat's bottom, as a form of drop-keel.

Chain Locker.—Compartment in forward lower portion of ship in which anchor chain is stowed.

Chinsing.—Same as calking.

Chock.—A block of wood or steel used as a filling or supporting member; also a heavy fitting or casting through which ropes or hawsers may be led.

Cleat.—A wood or iron fitting having two horns around which a rope may be wound.

Clew.—The lower corner of a square sail, or the aft lower corner of a fore and aft sail. Also a metal fastening or eye worked into the corner, for tying a rope.

Coaming.—The vertical edge of a hatchway or skylight; a low curb to keep out the water. The lower strake of deck house plating, usually heavier than the plating above it.

Coffer Dam.—A narrow void between two bulkheads or floors to insure liquid not leaking from one tank to another.

Cradle.—A heavy framework for supporting a vessel, as in dry dock or while being hauled up on a marine railway.

Crosstrees.—Beams placed athwartships at the head of a mast.

Cutwater.—Sharp-edged projection set in front of a vessel's stem at the waterline.

Davits.—Heavy vertical pillars with the upper ends bent to a curve, between which a boat is supported and swung on deck. The boat is loaded on the deck, and then the davits are turned so that the boat hangs overboard, when it may be lowered to the water. Modern mechanical davits are arms that shift the boat overside either by sliding on a track or they may be hinged arms moved by a worm and nut mechanism.

Deadeye.—A block with holes through which ropes are run after the manner of a pulley block, but without sheave or pulley.

Deadlight.—A term applied to a port light that does not open.

Deadweight.—The difference between the light displacement and the full load displacement of a vessel; the total weight of cargo (or ammunition, gasoline), fuel, water, stores, dunnage, passengers, and crew and their effects that a ship can carry when at her maximum allowable draft.

Deadrise.—See RISE OF BOTTOM.

Deck.—A deck or platform in a ship corresponds to a floor in a building. It is the plating, planking, or covering of any tier of beams above the inner bottom forming a floor, either in the hull or superstructure of a ship. Decks are designated by their location as upper deck, main deck, etc., and forward lower deck, after superstructure deck, etc. Decks are sometimes identified by letters such as the "A" deck or "C" deck.

Depth Molded.—The vertical distance from the molded base line to the top of the freeboard deck beam at side, measured at midlength of the vessel, or to the uppermost continuous deck of shelter deck vessels.

Displacement.—The volume of fluid displaced by a freely floating and unrestrained vessel, the weight of which exactly equals the weight of the vessel and everything on board at the time the displacement is recorded. Displacement is usually expressed in either cubic feet or in tons of salt or fresh water (long tons, 2240 lbs.).

Double Bottom.—A term applied to the space between the inner and outer skins of a vessel called respectively the "inner bottom" and "shell," usually extending from bilge to bilge and for nearly the whole length of the vessel fore and aft, and subdivided into water or oil tight compartments. In some cases, and generally in warships, the inner bottom is carried above the bilges to a deck at or near the waterline.

Draft.—The depth of water that a vessel draws, measured vertically from the lowest points of the hull to the surface of the water. If the propellers project below the lowest point of the hull that establishes the extreme draft.

Drag.—The designed excess of draft, aft, over that forward, measured from the designed waterline. The drag is constant and should not be confused with trim.

Dry Dock.—A dock into which a vessel may be floated and then, by removing the water, leave the interior dry for repairing. There are floating dry docks which may

be partially submerged, the vessel being lifted out of the water by pumping the ballast water from the dock.

Dunnage.—Heavy pieces of wood or the like used to prevent cargo from shifting its position when the vessel is rolling at sea.

Even Keel.—When a boat rides on an even keel, its plane of flotation is either coincident with or parallel to the designed waterline.

Fair Lead.—The lead of a rope in a direction that will not permit it to foul or be subject to excessive friction; also a small fitting for changing the direction of a rope without causing too much friction.

Fake.—A single turn or coil of a line, rope or cable.

Fall.—A hoisting rope used with a block or tackle.

Fender.—A shield-like device for hanging on a vessel's hull at the waterline, to receive the shock of contact with a dock, pier, etc

Fidley.—A term applied to the top of a boiler casing through which pass the smoke flue and uptake.

Fore.—At, near or toward the bow, as foredeck, fore-ship (the bows), foreyard (the lowest yard of a foremast).

Fore and Aft.—Extending or situated longitudinally of a vessel; in line with the keel.

Fore Peak.—The watertight compartment at the extreme end of the vessel below decks. The forward trimming tank.

Forecastle.—The forward superstructure part of the hull, formerly the quarters for the crew.

Forward.—The locality at, near or toward the bow.

Forward Perpendicular.—A line perpendicular to the base line and intersecting the forward side of the stem at the designed waterline. Also see AFTER PERPENDICULAR.

Framing.—The framework or stiffening members; the skeleton of a ship.

Freeboard.—The part of a vessel's side that is free and clear when she is loaded, measured as the vertical distance from the freeboard deck to the water line.

Funnel.—Smokestack of a vessel.

Futtock.—A foot-hook or curved timber in the frames of a wooden ship, extending from a floor-timber or cross-timber upward.

Futtock-Plate.—An iron plate on a mast head for holding the dead-eyes of the futtock-shrouds.

Futtock-Shrouds.—Short shrouds at the junction of a mast with its topmast.

Galley.—The place where the cooking is done on a vessel; the kitchen.

Gangway.—A passageway or opening in the bulwarks for use in boarding a ship. Also a walkway from a pier to a ship.

Gantline or Girtline.—A rope reeving through a single block aloft and used for hoisting or lowering rigging, drying clothing and hammocks, etc.

Garboard Strake.—The strake of bottom shell plating next to the keel.

Gimbal.—A support for a compass or other object which it is desired to maintain in level position, made in pairs, and permitting the object supported to swing level regardless of a ship's rolling or pitching.

Gross Tonnage.—See TONNAGE.

Gudgeon.—A lug cast or forged on the stern post for the purpose of hanging and hinging the rudder. Each is bored to form a bearing for a rudder pintle and is usually brushed with lignum vitae or white bearing metal.

Gunwale.—A term applied to the line where a weather deck stringer intersects the shell. The upper edge of the side of an open boat.

Halliard or Halyard.—A light rope for hoisting a sail, yard, etc.

Hatch.—A large opening through a deck, as for taking in cargo.

Hawse.—The hawse-hole is a hole in a vessel's side for the passage of a hawser, and when not in use is closed with a hawse-plug. A hawse-pipe is a large fitting attached to the bow through which the anchor chain passes.

Hawser.—A large rope, such as 5 to 10 inches in circumference, used for securing a vessel to a pier or to another vessel.

Head.—The forward or upper end of a vessel, mast, sail, etc. Also a term for a ship's toilet.

Heel.—The inclination of a ship to one side, caused by wind or wave action or by weights on board.

Helm.—The tiller; also, the tiller and rudder mechanism collectively; also the direction in which the tiller is turned, being opposite to the rudder's position.

Hogging.—Bending strain lengthwise of a ship, tending to allow the bow and stern to settle lower than the section amidships. See SAGGING in this article.

Hold.—The space below the lowest deck; the main compartment in the lower part of a vessel, for carrying cargo.

Hounds.—A pair of projections at a masthead, for supporting the top trestletrees and rigging.

Hull.—The body of a ship or vessel; the framing as covered with planking or plating. The term is sometimes used to include the decks.

Inboard.—All inside a ship, toward the center line.

Intercoastal.—Occurring between ribs, frames, etc. The term is broadly applied, where two members of a ship intersect, to the one that is cut.

Jacob's Ladder.—A flexible ladder, usually rope, used by pilots in boarding ship at sea, also for entering ship's holds.

Keel.—A centerline strength member running fore and aft along the bottom of a ship. It is composed either of long bars or timbers scarfed at their ends or by flat plates connected together by riveting or welding. See also BILGE KEEL.

Keelson.—A beam or stringer, extending over or along a keel; an auxiliary or strengthening keel-piece.

Kingpost.—A strong vertical unstayed post used instead of a mast to support a derrick boom.

Knightheads.—A pair of uprights supporting the bowsprit on either side.

Knot.—A unit of speed, equaling one nautical mile (6,080.20 feet) an hour, as when a ship goes ten nautical miles per hour, her speed is ten knots.

Launching.—A term applied to the operation of transferring a vessel from the building ways into the water. End launching and side launching methods are employed; the former method is used when the vessel is built at an angle, usually at right angles, to the water front and the vessel is launched stern first, while in side launching the vessel is built parallel to the water front and launched sidewise.

Length Between Perpendiculars.—The length of a ship measured from the forward perpendicular to the after perpendicular. In naval practice, the total length on the designed water line.

Length, Overall.—The length of a modern ship measured from the foremost point of the stem to the aftermost part of the stern, but not including such movable objects as the ensign staff.

Lines.—The shape or contour of a vessel. When drawn full size on the floor of a mold loft, the templates may be made directly from them.

Longitudinal.—A term applied to the fore and aft girders in the bottom of a ship. These girders are usually made up from plates and shapes and are sometimes intercoastal and sometimes continuous. Also fore and aft members corresponding to beams.

Magazine.—A compartment or storage room on a vessel of war for the safe storage of ammunition.

Margin Plate.—The outer boundary of an inner bottom, usually sloping, and connecting it to the shell.

Marlin.—A double threaded, left handed tarred cord, about ⅛" diameter, made of hemp.

Martingale.—A vertical spar under the bowsprit, a dolphin striker; also a lower stay for a jib boom.

Mast.—A long pole of steel or wood, usually circular in section, one or more of which are usually located, in a nearly upright position, on the center line of a ship and stayed by rigging. Originally intended for carrying sails, they are now more generally used as supports for the rigging, cargo and boat handling gear and wireless equipment. Also see KINGPOST.

Metacenter.—The center of buoyancy of a listed vessel is not on the vertical center-line plane. The intersection of a vertical line drawn through the center of buoyancy of a slightly listed vessel intersects the center-line plane at a point called the metacenter.

Metacentric Height.—The distance from the metacenter to the center of gravity of a vessel including her deadweight load. If the center of gravity is below the metacenter the vessel is stable.

Midship.—See AMIDSHIPS.

Mold Loft.—A space used for laying down the lines of a vessel to actual size and making templates therefrom for laying out the structural work entering into the hull.

Mooring.—Anchoring or securing a ship to a pier or moorings so that she will not be free to swing with the tide or current.

Net Tonnage.—See TONNAGE.

Oakum.—A substance made from soft vegetable fibre such as hemp and jute impregnated with pine tar. It is principally used for calking the planking on wood decks of steel vessels and for calking all the planking on wood ships where watertightness is desired. It is also used for calking around pipes.

Outboard.—Away from the center line, toward or beyond the side of a ship.

Overhang.—Any portion of the hull or superstructure of a vessel outside a line drawn vertically from the waterline.

Panting.—The in and out pulsation of shell plating under the influence of varying temperature, strains, pressure, etc.

Peak.—The highest point of a fore and aft sail. See AFTER PEAK and FORE PEAK.

Pier.—A wharf built out into the water at right angles or obliquely to the shore. Long narrow piers are known

as finger piers. The end of any pier is called the pierhead.

Pillar.—A column or stanchion, as for supporting the deck.

Pintle.—A pin on the rudder, turning in a gudgeon forming a hinge on which the rudder turns.

Platen.—Skids on which structural parts are assembled for welding or riveting into subassemblies.

Poop.—The after, upper superstructure of the hull of a vessel where the steering gear is commonly located.

Port.—The left hand side of a vessel, when facing forward, opposed to starboard. Also an annular opening in the hull, a porthole, airport, cargo-side port.

Propellor.—A device of angular blades, arranged to balance each other and rotate rapidly in the water, driving a vessel on the principle of a screw. It has almost wholly superseded the paddle wheel because it is mechanically superior.

Purchase.—Any mechanical advantage which increases the power applied, such as a block and tackle.

Quarter.—The part of the side of a vessel's stern that is aft of the main chains; also the part of a yard that is outside the slings.

Quarter Deck.—That portion of the weather deck between the poop and the mainmast. Formerly reserved for officers' use, now rarely fitted in modern vessels.

Rail.—The upper edge of the bulwarks. Also applied to the tiers of guard rods running between the top rail and the deck where bulwarks are not fitted.

Rake.—Inclination from the perpendicular, applied especially to the degree of backward inclination of a vessel's masts or funnels. A craft is said to be rakish when her masts or funnels have a more than ordinary lean away from the upright.

Ratline.—A small cross-rope between the shrouds equivalent to the "rung" of a ladder.

Rig.—The style of arrangement of the ropes, sails, spars, etc., of a vessel, frequentiy used in compound words, as square rig, fore and aft rig, etc.

Rigging.—The cordage or wire rope equipment of a vessel. The permanent ropes are called standing rigging and the movable ones running rigging.

Rise of Bottom.—The amount that the flat portion of a ship's bottom is sloped above the horizontal from the keel to the side of the ship. Usually called deadrise.

Roll.—The motion of a vessel from side to side, causing an alternate raising and lowering of each side of the decks.

Rudder.—A device used in steering or maneuvering a vessel. The most common type consists of a flat slab of metal or wood, hinged at the forward end to the stern or rudder post. When made of metal, it may be built up from plates, shapes, and castings, with or without wood filling, or it may be a casting. The rudder is attached to a vertical shaft called the rudder stock, by which it is turned from side to side.

Rudder Post.—A heavy vertical post at the after end of the stern frame, which supports the rudder. See STERN FRAME.

Rudder Stop.—A fitting to limit the swing of the rudder.

Sagging.—A straining of the ship that tends to make the middle portion lower than the bow and stern; opposed to hogging.

Sampson Post.—See KINGPOST.

Schooner.—A vessel with two or more masts having fore and aft sails on all masts.

Scuppers.—Drains from decks to carry off accumulations of rain water, condensation, or sea water. The scuppers are placed in the gutters or waterways on open decks and in corners of enclosed decks, and connect to pipes leading overboard.

Sea Anchor.—A float, as of broken spars, lashed together and thrown out to windward from a disabled vessel to serve as a drag, that it may ride out a gale bow on. Usually provided for lifeboats.

Shaft.—A very heavy, long cylindrical steel forging for connecting the engine with the paddle wheel or propeller.

Shaft Tunnel.—In a modern steamship, an enclosed alleyway containing the shaft, and running fore and aft from the engine room to where the shaft emerges. Also called shaft alley.

Sheave.—A pulley wheel as used in a block for turning a rope. The word is primarily used for the grooved wheel, but the entire pulley block is sometimes called a sheave.

Sheer.—Fore and aft rise of the deck lines giving curvature to the deck.

Sheer Strake.—The upper strake of the main shell plating, just below the bulwarks.

Sheet.—A line or tackle from the clew of a fore and aft sail to the deck or from the after end of a boom to the deck.

Shell Plating.—The steel plating forming the outer skin of the hull.

Ship.—A sailing vessel, of three or more masts, square rigged on all masts; also a large power driven craft; popularly, any large floating vessel.

Shrouds.—Two or more stout ropes, often of wire, from a masthead to the rim or side of a ship, constituting a part of the standing rigging, and being supplied with ratlines serving as a rope ladder for ascending and descending. The stay ropes or chains of a topmast or bowsprit are also sometimes termed shrouds.

Sloop.—A fore and aft rigged sailing vessel with one mast.

Snubbing Post.—A post or pile at a pier or wharf, around which a cable can be turned, to check the motion of a vessel in landing.

Spar.—Any round timber for supporting a sail or sails or for handling cargo as a mast, yard, boom, etc.

Sparring.—Wood strips, usually 2″ x 6″ spaced 6″ apart on the inboard side of the frames to keep the cargo away from the shell plating.

Stability.—The tendency of a ship to remain upright, resisting rolling and pitching. See METACENTRIC HEIGHT.

Stanchion.—Columns or supports for decks, hand rails, etc. Stanchions are made of pipe, steel shapes, or rods according to the location and purpose they serve.

Starboard.—The right hand side of a vessel when facing forward; opposed to port.

Stay.—The rope, whether fibre or wire, that supports the lower masts, topmasts, top-gallant masts, etc., in a fore and aft direction. Backstays often lead to the deck edge well abaft of the mast.

Stealer.—A strake of shell or deck plating that does not extend all the distance to the bow or stern.

Stem.—A nearly vertical member forming the extreme bow of a ship, formerly a very heavy timber continuation of the keelson, now a stout forging or casting running from the keel to the weather deck.

Stern.—The after end of a vessel's hull.

Stern Frame.—A large casting or weldment attached to the after end of the keel to form the ship's stern. It holds the rudder post and in a single screw ship includes the propeller post with an aperture for the propeller.

Strake.—A term applied to a continuous row or range of plates. The strakes of shell plating are usually lettered, starting with A at the bottom row or garboard strake.

Stringer.—A term applied to a fore and aft girder running along the side of a ship and also to the outboard strake of plating on any deck. The side pieces of a ladder or staircase into which the treads and risers are fastened.

Tack.—The lower forward corner of a fore and aft sail.

Tackle.—A set of ropes, pulley-blocks, hooks, etc., constituting a hoisting equipment, as a block and tackle.

Taffrail.—The rail around the top of the bulwark or rail stanchions on the after end of the weather deck.

Tank Top.—The inner or upper plating of a ship's double bottom, as considered from the inside.

Throat.—The corner of a fore and aft sail at the gaff jaws.

Thrust-Block.—A heavy bearing for receiving the thrust or pressure of a propeller shaft.

Tie Plate.—A single course of plating run fore and aft under the beams of a wooden deck to strengthen the structure.

Tiller.—The fore and aft arm attached horizontally to a rudder head for operating the rudder.

Tonnage.—*Gross:* The entire internal cubic capacity of a vessel, except for certain exempted spaces, expressed in terms of "tons" taken at 100 cubic feet each. *Net:* The internal cubic capacity of a vessel which remains after the capacities of certain specified spaces have been deducted from the gross tonnage to allow for certain spaces not available for cargo—expressed in terms of "tons" taken at 100 cubic feet each. Tonnage should not be confused with displacement or deadweight. It is a volumetric term as distinguished from weight.

Transom.—The aftermost transverse frame in a ship.

Transverse Frame.—An athwartship member of a ship's framing forming a rib.

Trestletrees.—A pair of timbers set at right angels to and near the top of a lower mast to support the mast above.

Trim.—To change by ballasting the inclination of any floating vessel relative to her designed waterline when the vessel is floating on an even keel, without making her unstable. Classification, registration, and other authorities having jurisdiction usually provide that any vessel shall have tanks for liquid ballast, fore and aft, port and starboard, prior to classification or registration.

Tumble Home.—An inboard sloping of a vessel's side above the line of greatest beam.

'Tween Decks.—The space between any two continuous decks.

Vertical Keel.—Fore and aft vertical plating extending longitudinally along the center of a flat plate keel. Also called center keelson.

Waist.—The central section of a ship, between the poop deck and the forecastle.

Warping.—The shifting of a floating vessel to a new

position by means of a cable (often called a warp) attached to a pile or bollard on a dock.
Waterline.—The lowest visible part of a ship's hull when in the water; hence, a line corresponding with such level, as the load waterline, light waterline, etc.
Weather Deck.—A deck exposed to the weather having no overhead deck completely covering superstructure.
Welding.—The process of fusing and uniting metals by the application of intense heat without compression or hammering.
Well.—A compartment or boxed-in space low down in a vessel's hull, as for enclosing a pump, a propeller shaft or for holding water, etc. Also a low portion of weather deck between higher superstructures.
Wharf.—A landing place or platform built out or into the water for the berthing of vessels and running parallel with the shore line.
Winch.—A hand or power driven machine having one or more drums for winding rope. Used for hoisting or for handling the ship's lines.
Yard.—A spar for carrying sail, set athwartship and the principle member of a square rig.
Yardarm.—The tip of a yard, of historical interest as the proper place from which to hang a pirate.

CLIFFORD C. KNERR,
Secretary, Shipbuilders Council of America.

SHIPPING BOARD, United States. Created Sept. 7, 1916 by congressional enactment, it controlled the Emergency (later Merchant) Fleet Corporation. Abolished June 10, 1933, its functions were assumed by the Commerce Department; then (Oct. 26, 1936) by the U.S. Maritime Commission; lastly by the Maritime Administration, Commerce Department, May 24, 1950.

SHIPPING SUBSIDIES, in the broader economic sense, any bounty paid by a government with the object of encouraging the building and navigation of merchant ships. Under this definition would be included, and rightly so, the postal subventions paid by many governments for regular mail service between home and foreign ports, for the largest effect of such service is the development and maintenance of a merchant marine.

Subsidies to shipping have been classified as direct and indirect: the first where money is paid to the shipowners; the second where they are favored in other ways. Direct subsidies have been granted by various nations and at various times upon five different basic plans, as follows: (1) on the number of days of actual sailing in the year; (2) on the year's mileage; (3) on the tonnage of the vessels engaged in the trade; (4) on the tonnage as modified by speed; (5) on a scale in which tonnage, speed and the amount of cargo actually carried in the year are controlling factors. Indirect subsidies are of great variety, including government loans at low interest to shipbuilders; free registry; bounties to certain industries which produce export goods; remission or reimbursement of canal and port dues; and restriction of coastal trade to domestic shipping.

Most of the maritime nations have adopted the principle of shipping subsidies. France has given the most money, but without the increase in her merchant marine that such expenditure might be expected to induce. At the beginning of World War I (1914), Japan was paying out in subsidies annually about $7,000,000; and Japan's merchant fleet has grown and prospered exceedingly, but so many other factors are to be considered that it is an open question whether the system of subsidies is to be given the credit. On the other hand, Great Britain built up by far the largest of all national merchant marines without direct subsidies. The methods employed by several countries in recent years in fostering their merchant fleets are arranged below in alphabetical order.

Belgium.—No subsidies.

Denmark.—No subsidies; no mail subventions.

France.—Until the outbreak of World War II the French merchant marine enjoyed subsidies based on gross tonnages and dates of construction. These were intended to compensate for the special taxes imposed on the merchant marine by social legislation for the benefit of seamen. Also until 1939 the merchant marine received government aid in the form of long term credits at low interest for construction of new ships. After 1939 both types of legislative aid ceased. The only credits of an economic kind favoring French shipping in the Merchant Marine budgets after World War II have been the subventions granted the Cie. Générale Transatlantique and the Cie. des Messageries Maritimes in return for agreements to service certain routes with specific types of ships, these ships to make a specified number of voyages. The reciprocal obligations of the government and the two companies are set forth in conventions.

Great Britain.—No subsidies to British shipping in foreign trade. There are three subsidies paid directly or indirectly to assist coastwise shipping and United Kingdom consumers who receive goods by coaster. The first, known as the Coasting Liner Freight Equalization Scheme, enables the coastal liner companies which run in competition with the railways to quote rates in reasonable relationship with railway rates. The second, known as the Coal Freight Refund Scheme, equates the cost of carrying coal by coasting tramp vessels with that of moving it by rail; the scheme has the double effect of preventing the higher cost of seaborne coal from falling on consumers who must receive their coal by sea, and attracting to coasters cargoes which, in many cases, would otherwise pass by rail. The third subsidy, initiated in the early 1890's, is paid to David MacBrayne Limited, who maintain the steamship services between the western Highlands and islands of Scotland. Its object is to reduce freight rates and passenger fares for the benefit of the inhabitants of these sparsely populated areas. All these subsidies are subject to frequent review.

Netherlands.—In principle no credits are given by the Netherlands government to shipping companies. Modest credits were granted during some years following the economic world crisis of 1930.

Norway.—Subsidies (partly as an excess payment for mail service) to vessels on regular routes in the coastal trade. No subsidies to oceangoing ships; on the contrary, since World War II they have been subject to especially heavy taxation. Reimbursement of import duties paid on foreign material used in Norwegian shipyards for building or repairs cannot be regarded as subsidies to shipping, but to the shipyards.

Russia.—All shipping lines of the USSR are state owned and operated.

Spain.—Navigation bounties to Spanish ships manned by Spanish crews, based on mileage per ton gross; construction subsidies per gross registered ton, with additional 10 per cent for each knot of speed above 14; postal subventions.

Sweden.—No subsidies.

United States.—Coasting trade reserved to American ships; heavy mail subventions. The government program as to ships built during World War I and subsequently in government

yards was laid down in the Merchant Marine Act of June 5, 1920. This act was modified by the Merchant Marine Act of June 29, 1936, and by an amending act of June 23, 1938.

In the United States the first act authorizing postal subventions was that of March 3, 1845. Power was given to the postmaster general to make contracts for payments of specified rates on weight of mail carried to foreign ports—24 cents per half ounce for ports 3,000 miles distant; 10 cents per half ounce to Mexico and the West Indies. In 1847 a contract was made with the Ocean Steam Navigation Company for a mail service between New York and Bremen and Havre. The company was to receive $100,000 for six return voyages to Bremen per year and $75,000 for six voyages to Havre. In 1850 the Collins Line, plying to Liverpool, agreed to accept $19,250 per voyage, making 20 voyages a year. A number of similar contracts were made about the same time, but in 1858 the granting of mail subventions was abandoned and vessels carrying the mails were allowed only the sea postage plus the inland postage on mails carried. Postal subventions were allowed to lines running between New York and Rio de Janeiro and between the Pacific coast and China, but were discontinued in 1875 after running 10 years. In 1891 a law was enacted authorizing the postmaster general to make contracts with American shipowners for carrying the mails between American and foreign ports. Steamships were placed in four classes: iron and steel vessels of not less than 8,000 tons with a speed of 20 knots per hour; iron and steel vessels of not less than 5,000 tons, with a speed of 16 knots; iron and steel ships of not less than 2,500 tons and a speed of 14 knots; iron, steel and wooden ships of not less than 1,500 tons and a speed of 12 knots. This law is still in force, so far as it does not conflict with later acts. The requirement is that contracts be let to the lowest bidder qualified to perform them.

The act of 1936 vested in a commission the duties and functions of the old United States Shipping Board and set the broad lines of a shipping policy for the United States. The commission made a survey of the merchant marine and adopted a long-range program for replacements and additions to the American merchant fleet. In 1938 the commission contracted for the construction of 58 ships and projected the construction of 500 ships in the next ten years. Late in 1938 a new express and de luxe liner service between New York and the three republics of Brazil, Uruguay and Argentina was inaugurated and construction was begun on three passenger vessels for a trans-Pacific service. All ocean mail contracts in existence on June 30, 1937 were terminated and temporary operating-differential subsidy agreements were entered into with 16 steamship companies.

In 1948 two types of subsidies were in force: (1) the construction-differential subsidy, and (2) the operating-differential subsidy.

Under the first-mentioned the Maritime Commission is empowered to aid a citizen of the United States in the construction of a new vessel to be used on a service, route, or line in the foreign commerce of the United States, determined to be essential, by having the vessel constructed in a shipyard in the United States, to pay such construction costs, and to sell the vessel to the applicant for an amount equal to the estimated cost of the construction of the vessel if it were built in a foreign shipyard. The difference between the cost of constructing the vessel in the United States and the estimated cost of its construction in a foreign shipyard is termed a construction-differential subsidy; but in no case may such subsidy exceed 50 per cent of the cost of the vessel.

Under the operating-differential subsidy the commission is empowered to grant an operating-differential subsidy to aid a citizen of the United States in the operation of an essential service, route, or line in the foreign commerce of the United States. This subsidy, which is intended to place the proposed operations of such vessels on a parity with those of foreign competitors, is the excess of the cost of items of operating expense in which it is found that the applicant is at a substantial disadvantage in competing with foreign vessels over the cost of such items if the vessel were operated under registry of a foreign country whose vessels are substantial competitors of the vessels covered by the contract. See also UNITED STATES—NEW FEDERAL AGENCIES, *Maritime Commission, United States.*

SHIPPING OF THE WORLD. When World War I broke out in 1914, the world's shipping had reached its greatest known proportions. The year 1913 had been a record year in shipbuilding with nearly all the maritime nations. Great Britain had launched 641 steamers aggregating 1,919,578 tons and 47 sailing vessels aggregating 12,575 tons, the highest figure ever recorded for a year's output of tonnage in that country. Not all of this tonnage went to swell the numbers of the British fleet. Holland bought 89,992 tons; Norway, 54,111 tons; Greece, 39,999 tons; the British colonies, 37,118 tons, and Russia, 31,217 tons. With the exception of the United States, whose output of shipping for the year fell short of her 1912 figures by some 8,000 tons (due to a decrease of 42,000 tons in the yards of the Great Lakes), and slight decreases from previous record figures in France and Japan, all the other shipbuilding countries made substantial gains over their previous records. During 1913, then, the new ships launched had added 3,188,578 tons in steamers and 144,304 tons in sailing vessels to the world's grand fleet. The previous high record had been 2,919,763 tons (steam and sail combined) in 1906, and the average yearly addition to the world's fleet for 20 years past had been 2,341,500 tons. However, the yearly additions were not all clear gain. The losses in 1913 from collision, burning, foundering, wrecks, missing and abandonment at sea, together with those of vessels broken up as unseaworthy, amounted to 499,000 tons of steam vessels and 183,000 tons of sailing vessels, so that the net addition to the world's shipping in 1913 was 2,690,000 tons of steamers, and there was a net loss of 39,000 tons of sailing craft. This figure was very small by comparison with the losses of other years. In 1910 the tonnage lost amounted to 947,690 tons, and the average annual loss for 20 years had been 765,000 tons.

For a long period of years the tendency in the world's grand fleet has been an increase of steam vessels and a decrease of sailing vessels. The one exception has been Finland, whose persistent building of sailing ships long prevented any notable decrease in the sailing tonnage in Russia's shipping. Norway's sailing tonnage has been declining since 1890; Sweden's since 1880;

Denmark's since 1880; Germany's since 1880; Holland's since 1860; France's since 1860; Italy's since 1870; Austria-Hungary's since 1870; Greece's since 1870. In the case of the United Kingdom the date was 1870 and for the United States 1861. Not to go farther back than 1900, the percentage of sailing vessels in the world's grand fleet was 23 per cent; in 1915 it had fallen to 7 per cent.

The world's shipping on June 30, 1914, as recorded by the French Bureau Veritas, totaled 17,135 steamers of 100 tons or over, aggregating 23,840,675 net tons; and 21,924 sailing vessels of 50 tons and upward, aggregating 5,629,942 net tons: a grand total of 29,470,637 net tons—also recorded as 45,273,783 gross tons, a figure also of no small importance, as the sinkings by submarines are reported on the basis of the gross tonnage; the net tonnage being the vital figure in the carrying capacity of the grand fleet.

Table A, showing the distribution of 99.7 per cent of the world's grand fleet, was compiled from the records of the Bureau Veritas. The 26 countries named are arranged in the order of their steam tonnage. Only steam vessels of 100 net tons and over and only the sailing vessels of 50 net tons and upward have been counted. Many highly interesting facts appear from the figures in the table, among them the very large tonnage in sailing vessels, both actual and comparative, owned in the United States in the year cited. Though Great Britain shows a much larger number of such craft, their tonnage averages only 190 tons as against 420 tons for the United States vessels. Norway's sailing fleet is notable in showing the largest average tonnage in the table —750 tons; Belgium following with 730 tons and Peru third on that score, with 540 tons. The largest average tonnage for steam vessels is shown by Germany—1,880 tons; followed by Austria-Hungary, 1,800 tons; Netherlands, 1,740 tons, and Great Britain, 1,640 tons.

TABLE A.—SHIPPING OF PRINCIPAL NATIONS, JUNE 30, 1914.

	Steam vessels		Sailing vessels	
	Number	Net tonnage	Number	Net tonnage
Great Britain	6,594	10,785,503	4,945	935,467
Germany	1,510	2,852,797	1,041	426,919
United States	1,103	1,481,849	2,993	1,214,974
Norway	1,266	1,108,504	861	600,714
France	692	1,013,847	877	434,289
Japan	803	953,117	1,308	167,119
Italy	537	786,234	934	279,366
Netherlands	451	782,663	419	48,069
Sweden	940	641,347	1,117	162,289
Austria-Hungary	345	615,554	127	11,538
Russia	622	543,475	3,412	559,914
Spain	438	510,000	249	30,897
Greece	342	448,857	808	142,585
Denmark	470	429,337	615	78,514
Belgium	132	203,311	16	11,639
Brazil	257	174,295	303	67,791

Rumania	22	26,194	22	3,567
Mexico	30	22,095	47	8,512
Peru	12	17,370	58	31,390

With the breaking out of the war in July 1914 the destruction by war vessels of the merchant fleets of the belligerents began, and this destruction on the part of Germany and her allies was soon extended to include the shipping of neutrals carrying contraband, few attempts being made to capture them. In February 1917 the German government declared promiscuous war on all merchant vessels of whatever country found in certain specified areas of the open sea. This condition had already prevailed in some waters for several months previous to the declaration, and many vessels were sunk outside of the forbidden areas, and even those bearing safe conduct from Germany and in the so-called "safe" channels met the same fate.

Lloyd's Register of Shipping, in its edition for 1919–1920, made what is undoubtedly the most complete compilation of tonnage for the years 1914 and 1919, for the purpose of showing the losses in shipping during World War I years. The results are shown in Table B reproduced below. The *Register* also undertook to estimate the position of the world's tonnage as if there had been no war. It calculated the normal increase in tonnage for all the maritime countries by employing the same ratios of increase that had prevailed for several years prior to 1914. The result of these computations was the estimate that during the period 1914–1919 the British mercantile marine had lost 5,202,000 tons, and that the other nations, with the exception of the United States, had lost 9,000,000 tons, making a total loss of 14,202,000 tons. As a partial compensation, the United States had gained 6,729,000 tons, making a net loss in world tonnage of 7,473,000 tons. Germany's loss is given as 3,582,000 tons. Germany's 1919 tonnage shown in Table B includes all vessels which, at the date of the armistice, had not been captured or requisitioned by other countries. Among the neutral countries Norway was the greatest sufferer, losing 677,000 tons, while Italy lost 536,000 tons.

As a result of its researches, the *Register* estimated that the world had lost through the war 8,500,000 gross tons of shipping, representing a dead-weight carrying capacity of 12,500,000 tons. But recovery from these losses was swift. From June 1919 to June 1920 the total tonnage of the world rose from 47,897,000 to 53,905,000 tons.

TABLE B.—SHIPPING LOSSES DURING WORLD WAR I

COUNTRY	1914 1,000 gross tons	1919 1,000 gross tons	Difference, 1,000 gross tons
United Kingdom	18,892	16,345	−2,547
British Dominions	1,632	1,863	+231
United States	4,287	11,933	+7,746
Austria-Hungary	1,052	713	−100
Denmark	770	631	−339
France	1,922	1,962	+40
Germany	5,135	3,247	−1,888
Greece	821	291	−530
Holland	1,472	1,574	+102
Italy	1,430	1,238	−192
Japan	1,708	2,325	+617
Norway	1,957	1,597	−360
Spain	884	709	+375
Sweden	1,015	917	−98
Others	2,427	2,552	+125
Total	45,404	47,897	+2,493

Table C, compiled from the 1947–1948 and earlier editions of *Lloyd's Register,* shows the accelerated growth of tonnage caused by abnormal demands for cargo vessels by the Allied

TABLE C.—COMPARATIVE GROSS TONNAGE OF PRINCIPAL MARITIME NATIONS IN 1914, 1921, 1938, AND 1947.

Country	1914	1921	1938	1947
British Empire [1]	20,523,706	21,588,606	20,719,090	21,321,639
United States [2]	4,286,349	15,746,384	11,515,258	32,423,196
Denmark	770,430	883,052	1,129,556	1,024,292
France	1,922,286	3,298,795	2,880,783	2,314,898
Germany	5,134,720	654,407	4,231,657	591,442
Holland	1,471,719	2,208,433	2,852,012	2,436,385
Italy	1,430,475	2,467,537	3,258,992	1,300,987
Japan	1,708,386	3,354,806	5,006,712	5,808,832 [3]
Norway	1,957,353	2,371,051	4,613,175	3,760,941
Spain	883,926	1,111,563	947,963	1,130,004
Sweden	1,015,364	1,085,984	1,571,054	1,828,516
Others	4,299,163	4,075,707	8,143,899	9,572,640
Total steam and motor tonnage	45,403,877	58,846,325	66,870,151	83,513,772
Sailing and barge	3,685,675	3,128,328	976,360	842,458
Grand Total	49,089,552	61,974,653	67,846,511	84,356,257

[1] Includes Canadian lake tonnage. [2] Includes lake tonnage. [3] Includes tonnage sunk in World War II.

powers during two world wars, and the relatively slow increase during the intervening period when British, French and American tonnages declined, while German, Japanese and Norwegian tonnages showed phenomenal gains. The *Register* cautions that the total world tonnage shown for 1947 as 84,356,257 tons, indicating an increase of 16,509,746 since 1938, should be considered with reservations: Japan's tonnage figure for that year takes no account of shipping destroyed during World War II which, in 1947, was estimated as possibly in excess of 4,000,000 tons.

The total tonnage of the USSR (steamers, motor ships, sailing vessels and barges) was estimated in 1947 at 2,164,467, considerably less than that of France.

TABLE D.—NUMBER AND GROSS TONNAGE OF MERCHANT VESSELS OF 100 GROSS TONS AND UPWARD LAUNCHED IN PRINCIPAL NATIONS.

Country	1938		1946	
	No.	Tons	No.	Tons
United Kingdom [1]	267	1,030,375	371	1,133,245
United States	105	201,251	96	501,294
Belgium	21	30,197	13	17,451
Denmark	35	158,430	13	39,051
France	7	47,290	20	23,205 [2]
Germany	193	480,797	No	returns
Holland	142	239,845	23	33,290
Italy	13	93,503	57	61,742
Japan	146	441,720	No	returns
Norway	42	54,645	20	34,428
Spain	—	—	17	41,289
Sweden	40	166,464	50	146,875
Others	47	58,967	2	9,900

[1] Includes Northern Ireland. [2] Returns not completed.

The total tonnage of merchant vessels of 100 gross tons and upward launched in 1946, computed from the above Table D, amounts to 2,041,770 tons. However, the *Register* elsewhere gives a figure for "gross tonnage launched in 1946" of 2,127,421 tons, some 85,651 tons more than the tonnage listed in the table.

In the comparison between launchings in the last peace year before World War II and the first peace year since that conflict, it will be noticed that Great Britain and the United States were the only countries which showed an increase of tonnage in the postwar year.

SHIPS, Registration of. See MARITIME LAW.

SHIPS THAT PASS IN THE NIGHT, the title of a widely read story by Beatrice Harraden. It achieved notoriety when it was published in 1894 to some extent, very possibly on account of its taking title. The scene is laid in a Swiss winter resort for consumptives.

SHIPTON, shĭp'tŏn, **Mother,** an English prophetess about whose existence there seems to be no certainty, while there is no doubt that many of the sayings attributed to her were fabricated by others. According to S. Baker, who published Mother Shipton's pretended prophecies in 1797, she was born near Knaresborough, Yorkshire, in July 1488, and baptized as Ursula Southiel. She died, according to the same authority, at over 70 years of age, but it was not until 1641 that a pamphlet appeared containing some of her alleged predictions. In 1645 all her prophecies were considered as having been fulfilled. In 1862, a prediction was made, with Mother Shipton's name appended to it, that the world would come to an end in 1881.

SHIPWORM. See TEREDO.

SHIPWRECKS. See DISASTERS OF THE WORLD, NOTABLE.

SHIR ALI KHAN, shēr ä'lē khän, Amir of Afghanistan: b. about 1825; d. Mazar-i-Sherif, Feb. 21, 1879. He was the youngest son by a favorite wife of Dost Mohammed and was nominated successor to the throne to the exclusion of Mohammed Afzal Khan, the eldest son by another wife. Dost Mohammed died in 1863 and a fratricidal war ensued to determine the succession. In December 1863 Shir Ali secured the recognition of the British government to his succession, and in the contest that followed Mohammed Afzal was taken prisoner. The brother and son of the latter, who retained possession of Afghan-Turkestan, renewed the war, and in a battle which took place in May 1866 the majority of Shir Ali's troops deserted to the enemy. For the next three years Shir Ali's fortunes ebbed and flowed and at times he seemed likely to lose his throne forever. In 1869, however, with the recognition of the British he was fully established

on the throne at Kabul. In 1877 he became estranged from the British government, and refused to receive a British mission at Kabul. At the same time he made overtures to Russia and received her mission, while relations between Russia and Great Britain were strained. The British mission being a second time repulsed, war was declared and the British invaded Afghanistan. Shir Ali fled at the approach of the British and determined upon making personal appeal at Petrograd for an alliance against the British. The Russian government sent him messages declining to enter into any such alliance, but he persisted in his journey until he had crossed the Russian frontier, where he died suddenly. See AFGHANISTAN.

SHIRAS, shī'ras, **George, Jr.,** American jurist: b. Pittsburgh, Pa., Jan. 26, 1832. He was graduated from Yale in 1853 and from the Yale Law School the next year; received the degree of LL.D. from Yale in 1883. Admitted to the bar in his native city in 1856, he practiced there until he was appointed associate justice of the United States Supreme Court in July 1892. He retired March 1, 1903 on age limit, and died at Pittsburgh, Aug. 2, 1924.

SHIRATORI, shē-rä-tō-rē, **Toshio,** Japanese diplomat: b. Japan, 1887. A graduate of Tokyo Imperial University (1914), he entered the Foreign Office, was minister to Scandinavia and Finland (1933–1936), ambassador to Italy (1938–1942), then became a member of Japan's national council. He was known for his extreme Fascist sympathies on the eve of World War II.

SHIRAZ, shē'räz, Iran, capital of the province of Fars, lies in a high valley, 220 miles southwest of Isfahan, and is reached by lofty passes. It lies in a broad plain, 115 miles east-northeast of Bushire and 35 miles southwest of the ancient Persepolis, the ruins of which still exist. Its nearest point is Kodijan. It is much praised in Persian poetry for its climate, its wine and rose gardens. The city, with thousands of the inhabitants, was nearly destroyed for the third time in its history in 1853 by earthquake. The town now rebuilt contains mosques, a bazaar, but nothing noteworthy; the suburbs are more attractive. At the north are the tombs of the celebrated poets Hafiz and Sadi, both natives of the town. It is a center of trade, due to its position on the commercial routes leading from the port of Bushire. Shirâz is famous for its wines and inlaid work of wood and metals. It has extensive manufactures of silk and cotton, firearms, silverwork, pottery, rugs, etc. Pop. 129,000.

SHIRE, shē'rā, East Africa, a river in the southeastern part of the continent. It rises in Lake Nyasa, and, after a course of 370 miles, flows into the Zambezi. It is navigable except where interrupted for 70 miles by the Murchison Falls and Rapids, which have a fall of 1,200 feet. It flows through a rich agricultural country and, until railroads were completed in the 1930's, was an important commercial route to the lakes region. The Shiré Highlands are included in Nyasaland. There are several Scotch and English missions and settlements in the Shiré country. Cotton and grain are the chief products. The Shiré was explored by Livingstone (1858–1863), and the district was annexed as British territory in 1889. See also NYASA.

SHIRE, shēr or shīr, in the United States the more modern term *county* replaces this older name. Shire is an English term, still in general use in England, Wales and Scotland, although superseded by the modern form in most places; thus Derbyshire, Glamorganshire and Renfrewshire are "counties." In the United States counties are the first division of the state and township the next. The use of the word shire in the United States has no significance as to division; it is merely a portion of a name. Thus we have the "county of Yorkshire." But in England this is different; the suffix "shire" so used is in itself an indication that the division is a county.

It has been said that at different periods England was divided into shires. However, it is probable that all such statements are incorrect, and that although there exists in England a system of subdivisions known as shires, the country perhaps never was consciously so divided. If it be remembered that the Saxon people were a collection of clans and that these clans were divided into families, two or three large families to the clan, the seeming inconsistency of the above statement is explained. The head of the family was the supreme lawgiver in the family. He himself was under the leadership of the head of the clan, or tribal community. These tribal communities united to form what is known as hundreds, and the hundreds united to form shires. Thus the country instead of being divided into shires was formed by the union of many separate shires, each of which was, practically, an independent kingdom. Some of these small districts still exist—Norhamshire in Northumberland and Richmondshire in Yorkshire. It was after this union of shires under one national head, not a spontaneous process, but one of slow and at times retrogradal growth, that the shire took its position as a subordinate part of the kingdom. As such it had at its head the shire-reeves, whence the modern sheriff. The shire-reeve preceding the Norman Conquest was one of the two heads of the shire organizations, the other being the ealdorman (or earl), whence comes our modern alderman. The ealdorman seemed to represent the old organization and dignity of the shire when it was an independent kingdom; he shared certain offices with the bishop. But the shire-reeve was more particularly the representative of the king, and after the Norman Conquest he became purely a royal officer, with his importance considerably curtailed. He held the sheriff's tourn, an annual court to which came the vassals of the king. The appeal from this court was to the king himself, and from this appeal came the growth of the King's Court, in its three branches of King's Bench, Common Pleas and Exchequer. This court assessed taxes, also, and thus the sheriff became the financial head of the shire; to the Sheriff's Court, too, fell the election of knights of the shire, thus giving it the function of an assembly for the choice of shire representatives. From the time of the Plantagenet accession to the throne the importance of the shire organization decreased, the sheriff now being merely an aid to the county court (q.v.). (See COUNTY; FEUDAL SYSTEM). Consult Oman, Sir Charles, *England Before the Norman Conquest,* 5th ed. (1923); Jolliffe, J. E. A., *Constitutional History of Medieval England* (1937); Stenton, Frank Merry, *Anglo-Saxon England* (1943, 1947); Sayles, G. O., *The Medieval Foundations of England* (1948).

SHIRLAW, shĕr'lâ, **Walter,** American painter: b. Paisley, Scotland, 6 Aug. 1838; d. Madrid, 1909. He was brought to the United States in his second year, and began his artistic career in early manhood as a bank-note engraver. He exhibited for the first time in the National Academy of Design in 1861. After a course of seven years' study in Munich (1870–78) he adopted genre-painting as his specialty, and also accomplished a great deal of work in decoration and book and magazine illustration. He was one of the founders and the first president of the Society of American Artists, and in 1888 he became a National Academician. A memorial exhibition of 200 of his works was held in New York and other cities in 1911.

SHIRLEY, shĕr'lĭ, **James,** English dramatist: b. London, 18 Sept. 1596; d. there, 29 Oct. 1666. He was educated at Oxford and Cambridge, and, having taken holy orders, obtained a curacy near Saint Albans. He soon afterward went over to the Church of Rome. Then he removed to London, became a writer for the stage and acquired a reputation which caused him to be taken into the service of Queen Henrietta Maria. His first comedy was licensed in 1625, and from that date he produced many plays in rapid succession. In 1636 he went to Ireland to assist Ogilby in the management of the new theatre at Dublin. After his return, probably early in 1640, he wrote much, and was conceded the foremost of English playwrights. He died of exposure during the great fire. He was last of the notable series of Elizabethan and Jacobean playwrights; and his works, while frequently thin in plot and loosely constructed, are clever, suave and abounding in fancy. Besides 37 tragedies and comedies, he published a volume of poems. His best dramas are the tragedies 'The Traitor,' 'The Royal Master' and 'The Cardinal,' and the comedies 'Hyde Park,' 'The Ball,' 'The Gamester' and 'The Imposture.' The best edition of his dramatic works is that by Gifford and Dyce (1833). Consult Wood, 'Athenæ Oxonienses,' (ed. Bliss; 1817); Ward, 'History of English Dramatic Literature' (1875); Forsythe, R. S., 'Relations of Shirley's Plays to the Elizabethan Drama' (New York 1914); Nason, A. H., 'James Shirley, Dramatist: A Biographical and Critical Study' (New York 1915); Parlin, H. T., 'A Study in Shirley's Comedies of London Life' (University of Texas 1914).

SHIRLEY, William, American colonial governor: b. Preston, Sussex, 1693; d. Roxbury, Mass., 24 March 1771. He studied law and in 1731 came to America, settled in Boston, Mass., and there engaged in that profession. He was royal governor of Massachusetts in 1741–45, planned the successful expedition against Cape Breton in 1745, and in 1745–53 was in England, after which he returned to Massachusetts as governor. He made a treaty with the Eastern Indians in 1754, explored the Kennebec River, and erected several forts on its banks, and at the outbreak of the French War in 1755 was commander-in-chief of the British forces in North America. He planned the expedition of General Prideaux against Niagara and accompanied it as far as Oswego, but was superseded in his military command and in his governorship in 1756. He was later appointed governor of the Bahamas, a post he resigned in 1770, and then returned to Massachusetts, where he lived in retirement the remainder of his life. He wrote 'Electra,' a tragedy; 'Bertha,' a masque; 'The Siege of Louisburg' (1745); 'Conduct of Gen. William Shirley Briefly Stated' (1758), etc. Consult 'Correspondence of William Shirley' (New York 1912).

SHIRLEY, a novel by Charlotte Brontë, published in 1849. The scene is laid in the Yorkshire country, with which the author had been acquainted from childhood. The heroine, Shirley, was drawn from her own sister Emily. The book is richer in portrayal of character than in striking incident.

SHIRREFF, shĭr'ĕf, **Emily Anne Eliza,** English pioneer educator of women: b. 3 Nov. 1814; d. London, 20 March 1897. She was a daughter of Rear-Admiral Shirreff and with her sister Maria — afterward Mrs. William Grey — received an excellent education, especially in languages and history. The inadequacy of educational facilities for women impressed the sisters deeply and their first efforts to improve matters lay through the publication of several books of which they were joint authors. These include 'Letters from Spain and Barbary' (1835 or 1836); 'Passion and Principle,' a novel (1841); 'Thoughts on Self-Culture, Addressed to Women' (1850). Miss Shirreff was a staunch supporter of the movement to establish Girton College, and was honorary mistress there in 1870, as well as being a member of the executive committee until her death. With her sister she founded the National Union for Improving the Education of Women of all Classes out of which in 1877 came the college for women now known as the Maria Grey Training College. She was an advocate of the Froebel system, concerning which she wrote several pamphlets. She was also author of 'Intellectual Education and its Influence on the Character and Happiness of Women' (1858).

SHISHAK, shī'shăk, Egyptian king, the Sheshenk I of the monuments, and the first sovereign of the Bubastite or Libyan dynasty. Shishak I rose to the throne from being commander of the powerful Libyan mercenaries; to him Jeroboam fled for protection when he fell under the suspicion of Solomon (1 Kings xi, 40); and in the fifth year of Rehoboam he invaded Judah, whose fenced cities he took one after another until he arrived at Jerusalem which, according to the statements of Josephus, fell without a struggle. (Compare 2 Chron. xiii, 1–10). Shishak pillaged the temple and the king's palace, carrying off the treasures accumulated in the reigns of Solomon and David, and reducing Judah to the position of a tributary kingdom. He ascended the throne of Egypt about 980 B.C. and reigned at least 21 years. On the southern wall of the great temple of Karnak, in Upper Egypt, is a record of the conquests of Shishak and of the countries ruled by him. On this are four rows of prisoners. Each figure has his arms tied behind him, and a rope around his neck, and Shishak, a colossal figure, leads them by a string, meanwhile branishing a weapon. In the lists of his conquests during the expedition in which Judah was subjected to his rule we find the names of cities in both the kingdoms of

Israel and Judah and of several Arabian tribes to the south of Palestine. Among those of the cities which can be recognized in these lists are Rabboth, Taanach, Sunem, Rehob, Hapharaim Adoraim, Mahanaim, Gibeon, Beth-Horon, Kedemoth, Ajalon, Megiddo and Judah Maluk, "the royal city of Judah," or Jerusalem. A stele commemorating his invasion of Palestine and capture of Jerusalem was found on the plain of Esdraelon in 1926. All Egypt was under his sway. Consult Müller, W. M., 'Egyptological Researches' (Washington 1906).

SHITTIM WOOD. See KITTIM.

SHIVAISM, the religion of the Shivaites, or worshippers of Shiva or Siva, an ancient Dravidian divinity of southern India. His proper name was Mahâdêwa, "greater god"; but the title Shiva, "the good," was more generally applied to him by his votaries. While Shiva is the most popular of the Hindu pantheon, his worship more widely obtains in the south than in the north, although his throne is the Himalayas, and he is a destroying god, yet sometimes restoring and fructifying in influence. Thus in the south he is widely honored under the symbol of the phallus or lingam. Although he is a Dravidian god, in the struggle between Brahmanism and Buddhism he was adopted into the Brahmanistic system and identified with the Vedic Rudra, god of storms. Consult Barnett, L. D., 'Antiquities of India' (London 1913); Hopkins, E. W., 'Religions of India' (Boston 1895); Macdonnell, A. A., 'Vedic Mythology' (Strassburg 1898).

SHIVELY, Benjamin Franklin, American lawyer and senator; b. Saint Joseph County, Ind., 20 March 1857; d. 14 March 1916. He was graduated at the University of Michigan in 1886, and engaged in law practice at South Bend, Ind. He served in Congress in 1884–85 and in 1887–93. He was elected to the United States Senate for the term 1909–15 but died before its expiration.

SHOA, Italian East Africa, an important southern division of Ethiopia, before 1889 a separate kingdom, with ill-defined boundaries. It consists of a series of plateaus at 3,000 feet above sea-level, traversed by mountain chains, which, in the culminating point, Mount Metatite, near Ankobar, have a height of 10,700 feet. Its east portion, called Effat, has a less elevated and more generally sloping surface, which is highly cultivated, and yields good crops of grain, chiefly wheat and barley. Cotton also is extensively cultivated. The higher plateaus are devoted to pasture. Among indigenous trees is the *Juniperus excelsa,* which in the course of a century attains a height of 160 feet, with a diameter at the base of four to five feet. The exports of the province comprise grain and large quantities of a durable cotton cloth, and to these may be added, as articles of trade, coffee, gold-dust, ivory, gums and spices, ostrich feathers, hides, dye-woods, medicinal plants, etc. It contains Addis Ababa, capital of Ethiopia; and the chief city, Ankobar. Christianity was introduced as early as the 3d century, and is still professed by a large number of the inhabitants, though in a degenerate form. Pop. estimated at 2,500,000 of whom about 1,000,000 are Christians and the rest chiefly Mohammedans.

SHOALS, Isles of. See ISLES OF SHOALS.

SHOCK, a sudden vital depression of the body usually due to sudden derangement of the functions of the nervous system, and generally accompanied by a dilatation of the blood-vessels of the surface of the body and a marked decrease in blood-pressure. Such a condition may be brought about by both physically or psychically acting causes. A blow, a fall, a hæmorrhage, an operation, sudden fright, an appalling sight, a heartrending cry, sudden financial loss or great and sudden bereavement are among the many causes constantly acting to bring about such a condition. The symptoms of shock vary greatly according to the type of cause and the individuality of the patient. Sometimes the symptoms begin at once; under other circumstances the results may be delayed for a long period. A very severe form of shock is spoken of as surgical shock. This usually results from serious operations which involve nervous structures, take much time, and large quantities of anæsthetic. A condition closely resembling surgical shock may follow the severe hæmorrhage of placenta prævia, ectopic pregnancy, or other form of internal hæmorrhage. (See BLEEDING). Special types of shock develop from the violent action of heavy explosions in war. These affect the central nervous system and were extremely frequent in the Great War of 1914–18. The symptoms of shock are very characteristic. The face usually becomes blanched and pale, the body becomes cold and is covered with clammy perspiration, the hands and feet usually become icy, the brain seems to be in a whirl, and consciousness is lost or much clouded. The pulse is usually quickened; the arteries at the wrist are soft and easily compressed; the breathing is usually rapid and shallow, labored, and at times irregular. The eyes are often sunken and listless, and the temperature of the body is diminished one or two degrees. The most important single factor in pure shock of the type described is the sudden fall in blood-pressure. This is thought to be due to purely nervous causes, the most potent one of which is paralysis of the sympathetic nervous fibres. This causes sudden dilatation of the blood-vessels, loss of tone of the vessel-walls, with loss of blood-pressure; hence the symptoms, and oftentimes the resultant death. The action in the sympathetic nervous system is largely due to the implication of the suprarenal glands, and other glands of internal secretion. Sometimes the symptoms of shock are much less severe. There is temporary faintness, slight pallor and a feeling of nausea, and the attack passes off. Between this slight shock and the shock that results from the pugilist's "solar-plexus" blow, that may bring death, every variety of change may be noted. In severe accidents many patients, while not suffering from physical injury, are often prostrated and develop true railroad shock, or traumatic neurasthenia. (See NEURASTHENIA). Psychical shock may induce neurasthenia; it may be a potent cause of mental disease; or it may even cause death. The influence of shock upon pregnant women is of great importance. Shock in such circumstances may bring about miscarriage, or cause malformations of the fœtus. Mild cases of shock are recovered from without aid. A stage of reaction sets in, the patient becomes warmer, the blood-vessels

regain their tone, and equilibrium is restored. More severe attacks require hot-water applications to the extremities, hot tea or coffee by mouth, alcoholic stimulants, or even ergot or adrenalin. Massage and heat, and sometimes rectal injections of plain hot (110°–115° F.) water, or hot salt water (1 teaspoonful of salt to pint of water) are very useful in extreme cases.

SHOCK ABSORBERS. Even when vehicle springs have been carefully selected with due regard to the loads they are to carry, it is difficult to provide against the many variations in loads and speed that necessarily obtain under conditions of actual service. In automobiles especially it is found that a car which rides easily on good roads often proves decidedly uncomfortable on rough roads because the light springs cause the riders to be jostled about at any but the slowest rate of speed. To aid the springs and effect a compromise, shock absorbers have been devised. They are of various designs and are all intended to supplement the action of the vehicle springs. Two general divisions of absorbers may be noted, however, those which receive shocks caused by a sudden deflection of the spring and those which merely check excessive motion of the spring by what may be considered a variety of brake action. A very simple form of absorber is a rubber pad carried by a clip and attached at the centre of the spring, where on the chassis is fixed a bolt or bracket which, upon the sudden deflection of the spring, rests the frame and load upon the rubber buffer or pad. Another form of absorber is the auxiliary spring, usually a spiral, and designed to operate in conjunction with the main springs. Its function is to retard excessive motion of the latter. Absorbers of the brake action type consist usually of a pair of levers hinged together at one end and the other end attached to chassis and spring, respectively. A variety of this form has a cup and cam hinge, with steel springs inserted in the cup and pushing against the cam. Other designs of absorber consist of cylinders filled with oil and fitted with a piston and plunger rod. One member of these cylinder absorbers is of course attached to the frame or chassis while the other is attached to the axle. The piston acts as a check to any rapid movement of the plunger rod.

SHOE. See BOOTS AND SHOES; SHOE INDUSTRY IN THE UNITED STATES.

SHOE-BILLED STORK, or **WHALE-HEAD,** a large stork (*Balæniceps rex*) found on the White Nile. It is brownish-gray with black wings, tail and feet, the head is slightly crested, the bill short, broad and deep, with the tip hooked and mottled dusky and yellow. These birds, also known as "boat-bills," live in flocks in swampy woods and morasses, and feed upon all kinds of small reptiles, frogs, fish, mollusks and carrion. Although they perch upon trees, the nest is on the ground, a slight lining of grass, etc., in a slight hollow. The eggs are white and from 2 to 10 in number.

SHOE INDUSTRY IN THE UNITED STATES. History.— Shoes were brought to America by the first settlers, as part of their equipment. The Indians wore moccasins, and the white men adopted them until Thomas Beard, a shoemaker of Saint Martin's lane, London, came to Massachusetts Bay colony in 1629, bringing a supply of leather as well as a kit of tools, and became the first shoemaker on record in the colonies. As the colonies grew, other shoemakers came, and Johnson, in his 'Wonder Working Providence,' speaks of the shoe trade in 1654 as among the industries "enriching themselves very much." Many early settlers, being jacks of all trades, made their own shoes. Some raised the cattle and tanned the leather, of which their shoes were made. In New England, shoemakers tramped from settlement to settlement, making and mending shoes, and accepting board and lodging as part pay. In the larger towns, shoemakers set up regular shops. The shoemakers "inhabiting and housekeeping in Boston" were authorized to incorporate by the General Court of the Bay colony, and to enforce rules for the good of their trade. However, the Court provided that there should be no unlawful combination "for enhancing the prices of shoes or wages whereby the people suffer." The Court also provided that no butcher should make leather, that no tanner should make shoes and that no shoemaker should tan leather. It forbade the use of false and deceitful mixtures in making leather. Also it forbade the wearing of extravagant styles in footwear by persons of mean estate. Government regulation of the footwear industry during the war 1914–18 was mild compared to the government regulation during colonial times. The shoe industry flourished, as the colonies grew. But it was not strong enough to provide footwear for the soldiers of the Revolution, and Washington's troops left the bloody footprints of their bare feet in the snows of Valley Forge. John Adam Dagyr, a soldier of the Revolution, and a shoemaker, too, imported fine shoes from London and Paris, and studied them until he learned how to make shoes as good. He freely taught his skill to others. The newspapers spoke of him as "The Celebrated Shoemaker of Essex." They advised their readers to buy fine shoes made in America, instead of importing them from London and Paris.

After the Revolution, Congress put a protective tariff on shoes, and the tariff, with varying rates of duty, was kept in force until the present time when the duty on shoes is relatively high. The early 19th century was a golden era in the shoe industry. Shoemakers worked in little shops by their homes. The shops were called "ten footers" because they were 10 feet square. One of them is a permanent exhibit at the Essex Institute in Salem. The shoemakers read as they worked, or talked with visitors. Roger Sherman, a United States senator, who "never said foolish word," got his education by studying from books opened by his side as he made shoes. Henry Wilson, "The Natick Cobbler" who became Vice-President, got his first lessons in debate by discussing topics of the day with visitors at his little shop in Natick, Mass. Often, the minister was a Monday morning visitor at the shoe shop, and the Sunday sermon was discussed. A Bible was kept in many a shop. In large shops, the shoemakers often sang together. In small towns, men farmed in summer and made shoes in winter. Manufacturers of the cities sent cases of shoes in express wagons to the farmer shoemakers.

The kit of shoemakers of hand method days

consisted of a lapstone, a flat face hammer, awls, waxed ends, knives, rub sticks, a piece of sharkskin, used as is sandpaper today for buffing leather, and a bottle of blacking and other small equipment. Each shoemaker had his own kit of tools and "seat" on which he worked and kept his tools by his side. Some used their tools and seats for a lifetime. The pay was small and the employment irregular. A dollar a day was high pay. At one period, in Lynn, shoemakers were paid in orders on the union store, exchanging their orders each Saturday for flour, molasses, salt fish and other necessities. The uppers of many shoes were stitched by women who worked at home. "Binding shoes" this was called, and Lucy Larcom pictured it in her poem *Hannah at the Window Binding Shoes.*

The change from hand to machine methods in shoemaking makes a marvelous chapter in American industrial history. Thomas Blanchard (1788–1864), a Yankee mechanical genius, was challenged to make a machine to turn gun stocks. He did it. The machine was adapted to making shoe lasts. So it became possible to make thousands of lasts by machinery, where only one could be made by hand. The lasts were refined, and multiplied in style, and standardized in sizes, until there are the thousand and one varieties of today. Elias Howe (1819–1867), a struggling young machinist, invented the sewing machine. John Brooks Nichols, a Lynn shoemaker, adapted it to the sewing of uppers of shoes. Women ceased to "bind shoes" at home, or sew the uppers with needle and thread in hand.

Lyman Reed Blake (1835–1883), a South Abington, Mass., shoemaker, invented the McKay machine for sewing soles of shoes just before the Civil War. He worked on it nights, after doing a day's work in the factory. He realized that he didn't have the business ability to put his machine on the market. So he sold it for $70,000 to Col. Gordon McKay (1821–1903). When Blake asked Congress for an extension of his patents, he estimated that his machine had saved to the shoe trade $13,979,724.30.

This McKay machine revolutionized the shoe industry. The shoemakers who worked by hand in little shops at home could not compete against the machine. Factories were established and equipped with machinery. Shoemakers came from little shops to work in the factories. Machinery was invented and developed to supplement the McKay machine for sewing soles and for stitching uppers. One by one the hand workers gave place to the machine operators. Sixty different kinds of machines are used in an average factory at present, and one factory has 137 different kinds of machines which it uses in making a single pair of shoes.

Sidney W. Winslow (1854–1917), and others consolidated the several important shoe machinery companies into the United Shoe Machinery Company in 1899. It established a system of leasing machinery. Manufacturers pay so much royalty for each pair of shoes made on its chief machines. They buy outright the supplementary machines, which are used in preparing a shoe for the chief machine, such as a welt sewing machine, or to finish the shoe after it is sewed. The company has its machines in 98 per cent of the shoe shops of the country. It has strong branches abroad, in Europe, South America, Australia, and even in Asia and Africa.

In 1917 the company became the United Shoe Machinery Corporation, and expanded its activities by undertaking the manufacture of various articles related to the making of shoes. In 1926 it had 65 factories, of which nine were engaged in the manufacture of shoe machinery. During World War II a considerable portion of its facilities was devoted to war production, including light artillery. Since the war a great number of highly improved machines for shoemaking have been perfected and made available to the industry. Compo Shoe Machinery Corporation and International Shoe Machinery Corporation are among the other important factors in the manufacturing equipment field.

Production.—Through the development of machinery and the factory system, the production of shoes has been multiplied, wages in the industry have been greatly increased, the living conditions of the laborers have been elevated, and the quality and appearance of shoes have been markedly improved.

There were 1,599 shoe manufacturing establishments in the United States in 1899, according to the United States Department of Commerce. In 1919, after the close of World War I, the number declined to 1,449; by 1939 there was an additional sharp decline to 1,070; at the end of 1949 those reporting to the Bureau of the Census numbered 1,018.

Production of all types of shoes, other than rubber, in the United States in 1919 amounted to 331,225,000 pairs; in 1939 production reached 424,136,000 pairs; in 1946, which marked the all-time peak for shoe production in the United States, the total was 525,773,000 pairs; by 1949 production declined to 473,005,000 pairs. Production of shoes and leather was subject to rigid restrictions during World War II and sales of leather shoes were rationed at the consumer level. The record production of 1946 is attributed in large part to the fact that retailers were rebuilding their depleted inventories during that year.

In 1899 the value of footwear produced in the United States was reckoned at $258,969,580; by 1919 this total increased under the advance of prices in wartime to $1,155,041,436; in 1939 the total value of the product declined to $734,673,111; in 1947 it attained a total of $1,752,313,000, and by 1949 it again declined to $1,588,487,000.

The number of wage earners employed in the industry totaled 141,830 in 1899, increasing gradually to 225,216 in 1923, the peak year for shoe factory employment, and gradually declining to 172,310 in 1945, the last year for which employment figures are available.

The analysis of shoe production during 1949 in the United States by the Bureau of the Census, according to kind of footwear, showed totals for the principal classes as follows: men's, 97,769,000; youths' and boys', 16,869,000; women's, 207,241,000; misses', 29,228,000; children's, 25,717,000; infants', 22,552,000; babies', 13,239,000. Total production for 1949, including slippers for housewear, athletic and other footwear, was 473,005,000 pairs.

Geographically the shoe industry has tended through most of its history to be concentrated in certain centers and areas where raw materials and skilled labor have been readily available, but in more recent years it has spread itself to a greater degree. Since the industry originated in Massachusetts, that state always has led in shoe manufacturing and for many years towns

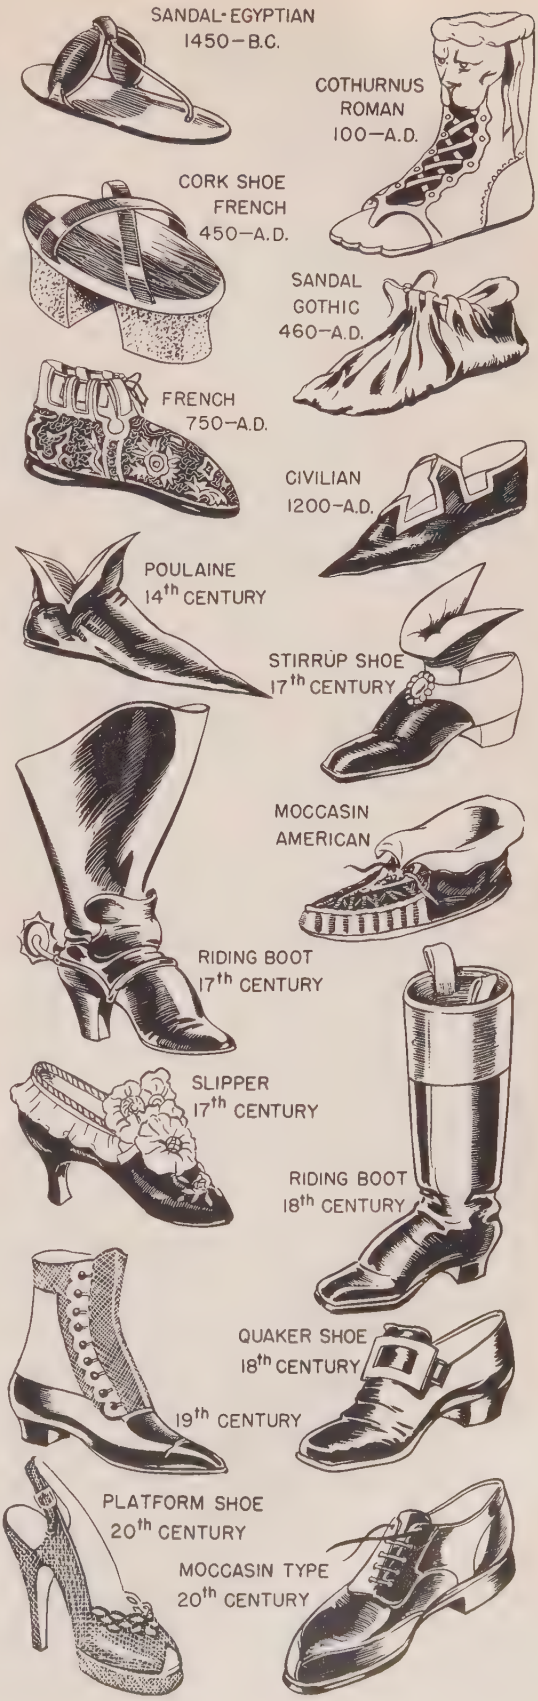
like Brockton, Lynn, and Haverhill were its foremost centers. Thence the industry spread to New Hampshire and Maine. New York City and several of the upstate New York cities, such as Rochester, Syracuse, Endicott, and Johnson City have played an important part in shoe manufacturing. In the latter part of the 17th and the early 18th century a section in New York City on the east side of Broadway around Maiden Lane was known as "the shoemakers' land." During the 19th century Brooklyn became a renowned center for the manufacture of women's fine quality shoes. Greater New York still maintains its prestige in the field of origination of footwear fashion. Duane Street is an important wholesale shoe center and the area around the Manhattan end of Brooklyn Bridge, including Spruce and Gold streets, forms the great leather market of the metropolis, known for years as "the swamp."

Since the end of World War I some of the historic centers of the industry in the Atlantic coast states have surrendered their position of unquestioned leadership to newer shoe trade areas in the Midwest, such as St. Louis, Milwaukee, Wis., and Portsmouth and Columbus, Ohio. Nashville, Tenn., is also an important center. Since World War II a considerable shoe manufacturing industry has developed in Los Angeles and southern California.

The old-time shoemaker, who worked in a little shop, made a case of shoes a week, or 6 pairs. The custom shoemaker made any sort of shoes his customers desired, for men, women or children. The factories of today specialize, one making men's shoes only, one making women's shoes only and one making children's only. Specialization is the secret of much of the progress of the American shoe trade. Some shops carry it so far that they make just one grade of shoes, over just one last.

Export.—Development of export trade in boots and shoes followed close upon the development of the American shoe factory system. Exports of shoes amounted to $419,000 in 1870. That was when machines were comparatively new, and machine-equipped shops made only a few shoes. In 1900 exports of shoes amounted to $4,000,000. Then all shops were machine equipped, and were able to produce more shoes than the home markets consumed. Exports to Cuba increased rapidly after the Spanish American War. Cuba is the best customer that American manufacturers have among foreign nations. Exports to South American countries began to increase after the completion of the Panama Canal. Exports increased enormously during World War I. For 1916 they amounted to 19,400,000 pairs, worth $42,500,000. Many of these shoes were for the armies of France and Italy. In 1929 shoe exports amounted to 8,562,000 pairs (men's, women's and children's) valued at $22,098,000. By 1944 the value of shoe exports had declined to $20,206,000.

Styles.—Styles in footwear have changed much, as people changed their activities. Puritans wore plain, square-toe shoes with buckles. Cavaliers wore great boots. People walked much, until railroads came, and necessarily wore stout footwear. Men of the colonial and early Revolutionary period wore small clothes, long stockings and low shoes with buckles. Jefferson provoked bitter criticism when, as



president, he first put on pantaloons and lace shoes. Women had one pair of coarse shoes for week day wear and a pair of fine kid shoes for Sunday best. Farmers wore knee high boots of heavy cowhide leather. A century ago New England manufacturers made many stogas (now stogies) or coarse brogans, for the slaves of the South. In pioneer towns it was a not uncommon practice for a thrifty farmer and his family to walk barefooted to town, carrying their shoes in their hands, and stop at the edge of the town to put on their shoes, and then walk in them to church. In grandmothers' time, serge Congress boots were common. They had uppers of cloth, with elastic gorings in the sides. Men wore Congress shoes, too. Children's shoes were crude. In shoemaking families, father's old boots were cut apart and were made over into shoes for the children. As the production of shoes multiplied, and the wealth of the people increased, a greater variety of shoes was produced, and people had at their command work shoes, dress shoes, dancing slippers, comfort shoes, fireside slippers, storm boots, fishing boots, baseball shoes, nurses' shoes and other kinds. Indeed, there is now a special kind of shoe for almost every employment or pastime.

Toward the close of the last century, a fashion of "toothpick toes" came in, for both men and women. These shoes had toes long and slim like a toothpick. The wearing of them cramped the toes, and broke down the arches of the feet, and tended to harm feet. To correct these faults, ingenious persons began to make arch supporters, toe protectors, corn plasters and other remedial devices. The sale of them runs into millions annually.

The period since World War I witnessed revolutionary changes in footwear fashions, beginning with the adoption of low-cut shoes for year-round wear, which occurred during the early 1920's. Prior to that time, low-cut oxford ties were worn quite generally in summer, but high-cut shoes for men and high-cut lace or button shoes for women were universally accepted for fall and winter. Shoe styles were generally standardized with minor variations in toe shapes and heel heights. The adoption of low-cut shoes for year-round wear, which came first in women's footwear, produced a multiplicity of new styles, including strap effects with ornamented fastenings, new tie effects, and elaborated pump patterns.

Younger men, especially college men, adopted low-cut oxfords for year-round wear at about the same time and within a few years most men were wearing low shoes in both summer and winter. Children's footwear tended to follow the development in men's and women's styles.

A somewhat similar change in shoe styles accompanied and followed World War II, when the casual trend in apparel and footwear swept the United States and resulted in the development of many designs of so-called play shoes, some with platform soles and wedge heels and many made by the California, or slip-lasted, process, which had been developed a short time before the war. Plastics, fabrics, and synthetic materials came into greater use, partly due to the wartime shortage of leather. These changes were most pronounced in women's and girls' shoes, but many new designs and patterns also appeared in men's shoes. More classic and conservative styles continued to be worn for street, business, and general use, since the new types were favored for leisure, sport, and recreation.

As standards of shoes have advanced through improvements in manufacture, there has also been improvement in the methods of taking care of shoes. The business of making shoe blackings is extensive. The business of blacking shoes is larger today than was the business of making shoes a century ago. Also, machinery for repairing shoes has been developed, and the modern repair shop established in every neighborhood. Now, according to estimates, 100,000,000 pairs of shoes are repaired annually, and the repairing business totals $300,000,000 annually.

Rubber.—Rubber footwear is comparatively modern. Early colonists wore snow shoes, or clogs and pattens, the latter being wooden soles which were strapped to the feet, over the regular shoes. The first rubber shoes, which appeared about a century ago, were called "gum shoes." They were made of pure rubber. They froze and cracked in cold weather, and they melted and stuck together in hot weather. It was not until Goodyear discovered his process of vulcanizing rubber that rubber footwear became practicable. The making of rubber footwear flourishes in Massachusetts, Rhode Island, Connecticut, and Indiana. Besides making storm footwear, commonly called "rubbers," the rubber shoe companies produce millions of pairs of sport and street shoes, called "sneakers." Rubber heels are made by the millions and during the last few years, the manufacture and wear of soles of rubber and fiber has increased rapidly. See also Boots and Shoes; Leather, Manufacture and Uses of; Leather and Shoe-Trade Technical Terms.

Revised by: Raymond L. Fitzgerald, Editor, "Boot and Shoe Recorder."

SHOEMAKER, Michael Myers, American author: b. Covington, Ky., June 26, 1853; d. Paris, France, Aug. 11, 1924. He studied at Cornell University and after 1874 traveled extensively over the greater part of the world, making special anthropological studies. He published *Eastward to the Land of the Morning* (1893); *Kingdom of the White Woman* (1894); *Sealed Provinces of the Tsar* (1895); *Quaint Corners of Ancient Empires* (1899); *Palaces and Prisons of Mary Queen of Scots* (1901); *The Great Siberian Railway* (1903); *Heart of the Orient* (1904); *Winged Wheels in France* (1906); *Wanderings in Ireland* and *Islam Lands* (1910); and *Indian Pages and Pictures* (1912).

SHOGUN, shō-gŭn, the highest officer in the Japanese government during the continuance of the feudal system. He was originally a purely military official, commander in chief of the army and first vassal to the emperor. The office became hereditary, and the shoguns gradually acquired nearly all the real powers of government, leaving only the title of royalty to the emperor. The latter resided at Kyoto while the shogun held court at Yedo (Tokyo) whence he ruled in the emperor's name as his major-domo. The shogunate was abolished at the Meiji Restoration in 1868. See also Japan—*History: From the Earliest Times to 1853.*

SHOLOM ALEICHEM. See Rabinowitz, Solomon.

SHONTS, Theodore Perry, American railroad official: b. Crawford County, Pa., May 5, 1856; d. New York, Sept. 21, 1919. He was graduated at Monmouth College in 1876 and for a time practiced law, but soon became interested in railroad construction. He was in charge of the construction of part of the Iowa Central Railroad and afterward built and was controlling owner of the Missouri, Iowa and Nebraska Railroad. He also gained control of the Toledo, Saint Louis and Western Railroad. In 1905–1907 he was chairman of the Isthmian Canal Commission, to which post he was appointed by President Roosevelt. He was president of the Interborough Metropolitan Railroad of New York 1907–1919, and president and director in many important railroad and trust companies.

SHOOTERS' ISLAND, an island in Newark Bay, separated by a narrow channel from Staten Island, N. Y., one mile east of Elizabeth, N. J. It is chiefly noted for its large shipbuilding plant.

SHOOTING STARS. See METEOR.

SHORE, Jane, mistress of Edward IV: b. London, 1445?; d. there, 1527. She was remarkable for her beauty and cultivated mind. Her influence with Edward was never exercised but for the benefit of others. (See EDWARD IV.) Richard III, partly to revive among the citizens the memory of the licentiousness of his brother, whom he accused of being "the chief abettor of that witch Shore," determined to expose her to public ignominy by accusing her of witchcraft. He was unable to effect his purpose but directed her to be tried for adultery by the Spiritual Court, which condemned her to do public penance in a white shift at Saint Paul's. She was reduced to poverty and appears to have died in 1526 or 1527. Her story appears in literature in Shakespeare's *Richard III;* in a tragedy *Jane Shore,* by Nicholas Rowe, in many old English ballads, and it has been introduced upon the French stage.

SHORE BIRDS, the sportsman's name for that large group of limicoline birds, as plover, sandpipers, curlew, phalarope, oyster-catcher, etc. (qq.v.), which are to be found along the beaches of the sea or other large bodies of water, where they seek their food at the edge of the waves. Shore bird shooting is an amusement of the autumn and early spring, when these birds are migrating between the South and the far northern breeding-places to which most of them resort in summer, and is usually carried on by the aid of stationary decoys, and calls for skill and patience.

Consult Coues, E., *Birds of the Northwest* (Washington 1874); Elliott, D. G., *North American Shore Birds* (New York 1898); Job, H. K., *Among the Water Fowl* (New York 1902); Seebohm, *Geographical Distribution of the Family Charadriidae* (London 1887).

SHORE LARK, a small bird (*Otocoris alpestris*), a native of the north of America, Europe and Asia. Within the United States it is found in winter as far south as North Carolina and Illinois. The adult male is about seven inches long; in summer, lores, cheeks, gorget and band on top of head, ending in erectile tufts, black; nape, mantle and upper tail coverts pinkish-brown, white beneath. The eastern or typical shore lark breeds along the northern border of the United States and in British America. In winter it migrates southward in flocks, which frequent open fields and the seaside meadows. In the western and interior parts of the United States numerous distinct varieties occur, some of which breed in the mountains within our borders. They range as far south as Texas and Mexico. The shore larks are closely related to the famous skylark of Europe. They nest in a depression in the ground and lay four or five eggs—French white, mottled with dull olive-green or yellowish-brown, but very variable. Nesting begins very early in the spring and several broods may be raised. The shore larks have a beautiful song which is often heard while they fly high in the air.

SHORE LINE, the dividing line between land and water in rivers, lakes or oceans. Shore lines are continually being modified by wave work, especially on the larger bodies of water. Waves strike blows averaging several hundred pounds per square foot and, armed with sand and gravel, are powerful agents of erosion. They undermine cliffs and carve out sea caves. In many places, especially along the chalk cliffs of England and France, where the rocks are soft, coasts are worn back at an average rate of several feet a year. The island of Helgoland, which in the year 800 A.D. had a circumference of 120 miles, today has a circumference of only three miles, and would probably be worn completely away, were it not for artificial protection.

The material thus worn away builds beaches. Where the debris is coarse, boulder or shingle beaches result; where finer, sand beaches are formed. Much sand is drifted parallel to the coastline by shore or littoral currents (q.v.), and where it drifts past some bend in the coast, the beach is prolonged into a spit extending past the bend out into deep water. Due to the constant action of waves and tides the ends of spits are often curved into hooks, as at Sandy Hook. If a spit or hook grows out so that it connects an island to the mainland, a tied-island results. On low, flat, gently sloping coasts, the waves break some distance from shore. At this point sand is heaped up by the action of waves and undertow, and an offshore or barrier beach is formed. Between it and the mainland is a lagoon or salt marsh, which gradually fills with decaying vegetation and wash from the land, and here peat (q.v.) beds are often formed. Off the mouths of large rivers, deltas (q.v.) are built and extensive mud flats or tidal flats occur.

Shore lines are profoundly modified by changes of level. Because the ocean bottom is smooth, the uplift forms long straight coasts, known as coasts of emergence. Along such coasts abandoned beaches and wave-cut cliffs may be seen well above water level, testifying to recent uplift. Such beaches are numerous on the coast of California. When lakes are drained or dry up, such abandoned beaches are also common, as around the old shore line of Great Salt Lake (q.v.). On the other hand, when a coast sinks, or is drowned or submerged as it is usually called, the sea enters the river valleys, forming long, narrow and often branching bays, like Chesapeake Bay. The tops of former hills may become offshore islands, as has happened at many points along the coast of Maine. Drowned shores afford the best har-

bors. The famous Inside Passage to Alaska is the result of deep drowning of a very mountainous coast. See OCEAN; LAKE; and the sections on *Oceans, Lakes* and *Diastrophism* in the article on GEOLOGY.

SHOREDITCH, a metropolitan borough of London, England, northeast of the City. Area 658 acres. Here, on the site of an ancient Benedictine nunnery James Burbage built the first English playhouse, The Theatre, in 1576, and a little later The Curtain. Chatterton lived in Shoreditch in 1770. The district is poor and crowded. Pop. (1938) 80,360.

SHOREY, Paul, educator: b. Davenport, Iowa, Aug. 3, 1857; d. April 24, 1934. He was graduated from Harvard University in 1878, and was admitted to the Chicago bar in 1880. He was professor of Greek at Bryn Mawr College 1885–1892, resigning in the latter year to fill a similar chair at the University of Chicago. He was professor in the American School of Classical Studies at Athens 1901–1902, and was appointed by Columbia University Roosevelt professor in the University of Berlin 1913–1914. He was managing editor of, and a contributor to, *Classical Philology* from 1908. He published *De Platonis Idearum Doctrina* (1884); *The Idea of Good in Plato's Republic* (1895); *The Odes and Epodes of Horace* (revised ed. 1910). *The Assault on Humanism* (1917).

SHORT BALLOT. See BALLOT.

SHORT CIRCUIT. See ELECTRICAL TERMS.

SHORT-EARED OWL, a small, nearly cosmopolitan owl (*Asio accipitrinus*), so called because its ear-tufts are inconspicuous as compared with those of its relative, the long-eared owl (*A. wilsonianus*). It is buffy, whitish, striped with dark brown, and 15 inches in total length. Its habits are those of ordinary owls (q.v.).

SHORT STORY. Characteristics.—The definitive nature of the short story is implicit in the adjective and noun comprising its name. As a story, it narrates a series of events, or a single incident, involving individuals in mental or physical activity. Thus, like all fiction, it portrays; and its success depends upon the immediacy achieved between the reader and the object portrayed. As a short story, however, it cannot effect this immediacy by the means common to the novel, such as leisurely characterization, detailed description, and repetition. Instead, it must portray with mirror-like swiftness and completeness.

For this reason, the short story is most powerful through graphic narration. This is not to say that its subject matter can be only simple and realistic. Of all literary forms, the short story is in fact the least restricted in subject matter, for its length permits treatment of subjects that could not alone sustain interest in a longer form. From earliest times, the short story has served as allegory, fable, and moral example. It has drawn themes from matter supernatural and natural, romantic and realistic, grotesque and mundane. The abnormal personality, as well as the representative one, may be portrayed by it; mental processes as well as physical action; casual happening as well as arresting incident. All these have a place in the short story, provided they are translated into the concrete. Growing consciousness of this necessity has forged the techniques that have made possible significant short-story writing.

Something of these techniques was known to the earliest storytellers, for traces of their application can be seen, for example, in the ballad, (q. v.) which is a short story told in song. In its objectivity, impressionistic description, directness of portrayal, and totality of effect, the ballad anticipates the principles expounded and applied by the greatest modern short-story writers.

Significant too is the ballad's origin in verse form, which dictated its storytelling technique. Many tediously long stories have of course been told in verse; but it is also true that verse, being disciplinary, is more conducive to artful brevity and compression than prose. It is more than coincidence that Edgar Allan Poe formulated his philosophy of the short story after he had studied balladry and his own method of poetic composition. It is significant too that Geoffrey Chaucer chose to cast his stories almost exclusively in poetic form; that in an age which smothered the short story by its heavy prose rhetoric, Edmund Spenser found in verse the best medium for his allegorical stories; that such poets as Robert Burns, Samuel Taylor Coleridge, and John Keats produced stories that might have been dictated by Poe's principles; that Robert Browning, in his dramatic monologues, achieved the character story ahead of the prose writers.

It has been essential to the development of the short story that, periodically, there should occur a turning back to folk literature and the laborious rediscovery of effective techniques once applied instinctively; for writers often forget that a single clear picture is worth a multitude of words. Especially the short story, because of its spatial limitation, must be a picture. As it is not, however, a picture composed of lines and color, but of words, it can appeal only indirectly to the senses. But what at first seems to be a deficiency is actually a source of strength, for the short story can appeal equally, if indirectly, to *all* the senses. Hence, in the short story, words achieve their maximum power when they create the illusion of sense-impression. It is not surprising, then, that in an age that develops a rhetorical style impeding the direct presentation of scene, the short story is extinguished; nor that the short story most naturally flourishes and develops in an age that expresses itself with simplicity and directness.

For this reason, the history of the short story reveals, not so much a steadily ascending line of continuity, as a series of peaks, which, until the 19th century, were widely separated in time. Each in a different way, Giovanni Boccaccio and Geoffrey Chaucer realized the rich possibilities of the form, but it was destined shortly to drop into obscurity. Over four centuries later, Edgar Allan Poe brought it into a state of self-consciousness by propounding a technique that was applicable far beyond his own stories.

Next to further the development of the short story was the advent of modern realism. As in all stages of the history of the short story, the importance of realism lies not in subject matter, but in the writer's attitude toward his material. The realist desires to portray what he sees exactly as he sees it; consequently, he will seek all means of graphic and direct portrayal. He will, furthermore, keep himself out of his picture, and as a result of this objectivity, his story

will contain its own verisimilitude, which is more pertinent to its success than the realism of the subject matter. Combining realism of attitude with deliberate technique, Guy de Maupassant wrote stories that endure as perfect models of their type.

The short story advanced in proportion to the writer's endeavor to transcend the limitations of his form. Even after the accomplishments of Poe and Maupassant, spatial limitation remained provocative. Thus, the short-story writer next sought means to *suggest* more than his space allowed him actually to say. This stage is best represented by Anton Chekhov, whose potent influence still motivates experimentation.

First Masters.—The *Decameron* of Giovanni Boccaccio (1313–1375) and the *Canterbury Tales* of Geoffrey Chaucer (1340?–1400) show how individual creativeness could breathe life into the conventionalized forms that were already the heritage of the short story. These writers drew freely from the great spontaneous stream of storytelling that started with man and flowed from the Orient through the Continent and on into England.

The frameworks of these two collections are in themselves evidence of the universal popularity of the short story as a prime and respected means of entertainment. The *Decameron* (q. v.) stories are told by a group of young men and ladies to while away the time in the idyllic retreat that shelters them from the grim plague raging in Florence. Chaucer's pilgrims tell their stories to shorten their journey to Canterbury, where they will pay homage to Thomas à Becket. In all the stories thus told, there is a spirit suggesting an effortless love of storytelling—a spirit soon to be lost as the story grew more literary and widened the gap between teller and listener.

Boccaccio drew chiefly upon the Milesian tale of the type loosely strung together in the *Golden Ass of Apuleius,* (q. v.) but source, or even form, is of minor importance when set next to the vitality that he brought to the short story. It was Boccaccio's zest for life, rather than an intellectual regard for technique, that forged his stories. The whole of the *Decameron* pulsates with emotion. Sometimes the motivating force is intense love or hate, but more often it is quite simply man's will to pleasure, the desire to attain satiation and then move on to new objects. His plots showing simply how satisfaction is achieved or denied, Boccaccio had little need to probe beneath the surface picture, or to individualize characters, for the basic drives of man are common to all. This first great Human Comedy suggests how the short story can survive, in spite of awkwardness of form, by virtue of the consistency and ardor of its creator's approach to life, and his ability to portray this ardor directly.

Unlike Boccaccio, Chaucer was a virtuoso of short-story form. The variety of form in the *Canterbury Tales* (q.v.) makes it a great roundup of the medieval short story. For example: a chivalric *romance* is told by the Knight; a *lai* (Celtic fairy tale) is the Wife of Bath's contribution; a saint's legend is piously related by the Prioress; *fabliaux* (realistic satires, especially pointed at the clergy and women) are told by the Miller, the Reeve, the Shipman, the Friar, and the Merchant; a *fable* is the *Nun's Priest's Tale;* and the *exempla* (short stories illustrating a general statement usually of a didactic nature) told by the Monk and the Pardoner indicate variety within the same form, for the Monk relates a mere list of tragedies, whereas the Pardoner's tale of greed is at once so concrete and suggestive that its existence alone would prove Chaucer a master of the short-story form.

Boccaccio's essential realism made him objective, but Chaucer's objectivity is a conscious story technique. In the general prologue, he makes a significant plea for realism, saying that the reader must allow him to tell the stories in the exact words of the pilgrims. The effect of this is the achievement of the necessary tone of each type—the ribaldry of the *fabliau,* the simple piety of the saint's legend, the delicacy of the *lai*—and, consequently, the removal of all traces of Chaucer the creator.

The subsequent history of the short story is comprised of the efforts of writers to recover the height reached by Boccaccio and Chaucer. The short story lost favor in the full bloom of the Renaissance. It could neither compete with the long prose romances and the drama, nor survive under the stylistic devices that puff up such writing as John Lyly's *Euphues* (1578, 1580). The writer's attention became fixed upon the techniques of expression, not those of portrayal. so that neither Chaucer's graphic clarity nor Boccaccio's direct realism was possible.

The advancement of science stimulated man's quest for certainty in communication, which was accompanied by a deliberate change to simpler prose style. New directness and simplicity are seen first in such nonfiction writings as René Descartes' *Discourse on Method* (1637) and John Locke's *An Essay Concerning Human Understanding* (q.v. 1690). These tendencies regenerated the novel, but the short-story form had been too long buried to be quickly resurrected.

True, there were glimmerings of the short story in the periodicals, and these essay-stories were to help lead American writers to an awareness of short-story form. Also, the journalist-novelist, Daniel Defoe (1661[1]–1731), struck off at least one piece—*True Relation of the Apparition of one Mrs. Veal*—which, with its combination of realistic technique and ghostly theme, retains the power to interest. Chiefly, however, writers had forgotten what to do with the short story. Novelists, aware of short-story material, frequently incorporated it into their novels. A notable example of this is the extraneous Man of the Hill story in Henry Fielding's *Tom Jones* (1749). What was needed was the directive force of men willing to declare the short story an independent form. In this, America was to speak first.

Craftsmen.—In 1842, Edgar Allan Poe remarked that the only noteworthy short-story writers produced by America were Washington Irving and Nathaniel Hawthorne. Of course, Poe should have included his own name. Interestingly, this triumvirate was significantly influenced by German and English romanticism. It was the peculiar ability of Irving (1783–1859) to borrow German legend and manipulate it so that it seemed indigenous to America. Except to the scholar Rip Van Winkle does not betray his German origin. In fact, *Rip Van Winkle,* and other tales with an American setting (in the *Sketch Book* and *Tales of a Traveller*), (qq.v.) created a body of American legend acceptable to even the

[1] Some authorities give birthdate 1659? and 1660?.

most fastidious, for Irving wrote in the style of the 18th century English essayists.

Not unnaturally, then, his pieces sometimes contain more of the essay than of the story, and the somewhat apologetic title *Sketch Book* suggests that he was not quite certain that the short story could stand on its own strength as a finished literary product. Even so, his humorous objectivity and occasional directness of portrayal made his tales something more than apologues. This new something was recognized by his first readers, and the great vogue of the *Sketch Book* led indirectly to the establishment of the many annuals, lady's books, and gift books that were soon to provide the first respectable home for the single short story.

With Nathaniel Hawthorne (1804–1864), the short story gained in conciseness, chiefly because he saw it as a means to question and probe as well as to portray aimless scene and character. Hence, his plots tightened into allegory, by which he could represent ideas in terms of concrete symbols. He was quite frank about his didactic concern, often indicating it in titles: *The Man of Adamant, an Apologue; The May-Pole of Merry Mount, A Parable; Egotism, or the Bosom Serpent.* Too often the abstract idea is apparent in the concrete symbol, so that the stories seem remote.

One of Hawthorne's favorite themes concerns the man who experiments with life rather than participates in it (*Wakefield* and *Dr. Heidegger's Experiment*). Hawthorne himself seems to be the scientist at work in the laboratory, not of life, but of the ideas abstracted from life. Thus, he achieves objectivity; but it is the objectivity of the lecturer who shows slides to illustrate what he has to say. Only rarely can his presence be forgotten, for there is the sound of his voice, or the shadow of his pointer. If illusion has been achieved, it is quickly shattered when the lights come up and he concludes without benefit of slides.

Hawthorne's collection of stories under the title of *Twice-Told Tales* (q.v.) provoked the definitive review in which Poe at last established the short story as an independent form. Because of its brevity and consequent emotional intensity and unity, Poe (1809–1849) had already assigned the short lyric first place in poetry; and, in his own stories, he had evolved a distinctive technique aiming at the same qualities. Thus, by 1842, he was ready to expound certain fundamental principles of short-story technique.

According to Poe, the short story (1) must be of such length as to be read in one sitting; (2) must create a single effect; (3) must not contain one word which in meaning or tone fails to point to that preconceived effect; (4) must convey the impression of finality, so that the reader desires neither an opening other than that provided, nor a continuation beyond the final sentence. These principles subordinate plot or theme to effect, thus setting up, for the first time, a criterion other than pure narration. Words are to be used for their emotive, rather than intellectual, power. Brevity is to be artful compression by the elimination of what detracts from the desired effect, and the abstraction of what enhances it. Significantly, these principles are applicable to any subject matter. It is presentation alone that defines the form.

Poe's influence was not only that of theory, for he applied as well as formulated his principles. He served a very deliberate apprenticeship in short-story writing by producing parodies of the Terror Tale that flourished in England and the Continent. Parody-writing taught him much, for the exaggerated stylistic devices he thus developed (*Shadow: A Parable,* for example) became instrumental in creating the single effects of such characteristic tales as *The Fall of the House of Usher* (q.v.) and *The Masque of the Red Death, A Fantasy.*

Poe's technique in theory and practice makes it clear that over and above his attraction for things of mystery and imagination was his rationalism. The fact that many of his tales were written to induce mood should not obscure the equally important fact that they were produced by the most objective approach to style and theme that had yet appeared in fiction writing. Starting with the single impression to be achieved, Poe isolated from the possible means of expression only those elements most productive of the desired effect. In a purely atmosphere-sketch such as *Shadow,* he secured the effect wholly by stylistic devices; but in a plot-story such as *Ligeia,* he extended the same isolating process to create incidents that would most effectively point the theme (power of the human will). In fact, Poe wrote his stories in the spirit of the detective who has solved the mystery but must carefully retrace his steps and re-examine the clues to construct a logical case. It is not surprising, then, that he should have put his technique to thematic use and thus created the detective story.

When from his mysteries Poe eliminated the supernatural, he originated a type of story distinct from the Terror Tale. In such stories, the reasoning process leading up to the solution of the mystery takes precedence over the mystery itself. Sometimes the ratiocination is almost mathematical (*The Gold Bug,* q.v.); sometimes it deduces the nature of the mystery from knowledge of the character of the culprit (*The Purloined Letter*); at other times it deduces the identity of the criminal from the nature of the crime (*The Murders in the Rue Morgue*). The true hero is Reason, which Poe personified in his character Dupin.

The modern detective story descended directly from Poe, but probably its lasting vogue is due to Dupin's first successor, Sherlock Holmes. Sir Arthur Conan Doyle (1859–1930) mixed Poe's method with the personality of an Edinburgh professor and created a character who has become legend to all classes of readers. As Sherlock Holmes is a fuller-bodied character than Dupin, so is his foil, Dr. Watson, who succeeded Poe's vehicular first person (the narrator).

In both his stories of reason and of imagination, Poe sacrificed many time-honored elements of fiction for the sake of his single effect. It is perhaps because of this sacrifice that Poe's stories were influential in his own country only after a long delay, and then in an indirect way. If, by concentrating upon the single impression, he avoided the loose construction of Irving's stories and the didactic allegory of Hawthorne's tales, he also lost concreteness of character and places. He created memorable plots, but not people; his stories have the coloring of moods, not localities. There is in his writing no intrinsic element to tie it to America. In contrast, it is instructive to note that Nikolai Gogol (born the same year as Poe) exerted inestimable influence over Russian

writers because of his portrayal of Russian people in Russian scenes. No American writer can say of any one of Poe's tales what Maxim Gorky said of Gogol's: "We all spring from Gogol's *Overcoat.*"

Paradoxically, however, Poe exerted great influence upon the short story in general. The power of that influence came from the specific nature of his technique as applied in his own stories, as well as the concise formulation of his theory of technique. Familiarity with his work arose especially in France, first through the plagiarism of hack writers (possible because of the lack of international copyright laws), and then more legitimately through the excellent translation of his tales by Charles Baudelaire. Interestingly, the next major achievement in short-story writing came from the French Maupassant.

Realists.—Although Guy de Maupassant (1850–1893) knew and was impressed by Poe in translation, he was by temperament and association more sensitive to the realism which was already giving new form to the fiction of both Russia and France. Under the exacting tutelage of Gustave Flaubert, Maupassant served a seven-year literary apprenticeship. Flaubert (1821–1880) was a realist, but over and above his conviction that the writer should draw his material from life, was his belief that the true value of art lay in form and expression. Maupassant did not ape his master's fastidious craftsmanship, but from him he gained a sense of form which outlines his stories with the same definiteness as Poe's.

Thus, Maupassant's realism is neither the spontaneous overflow of sensual delight that animates Boccaccio's tales, nor the experimental and formless naturalism of Émile Zola (1840–1902) and school. Rather, it is the reshaping of life data to illuminate the effect desired and to subordinate whatever is irrelevant to the effect. As he wrote in his preface to *Pierre and Jean,* "the realists of art ought rather to call themselves the illusionists." Striving for the effect of realism, Maupassant drew upon people and incidents, whereas Poe sought to achieve emotional effects by creating moods and atmospheres. Yet the techniques are essentially similar. For example, Maupassant isolates the sadism of Baron van Eyrick (*Mademoiselle Fifi*) in a series of illustrative incidents, just as Poe isolates human will power by portraying its triumph over death in *Ligeia.*

Maupassant was an ironist, but his expression of attitude is so embedded in plot and symbols that it seldom appears distinct from the actual narration. Both *A Piece of String* and *The Diamond Necklace* are constructed out of a juxtaposition of events and circumstances which not only constitute plot, but suggest the irony of fate. Still another kind of irony is expressed by the juxtaposition of types of people, showing especially the shallowness of the falsely self-righteous individual in contrast to the moral strength and sincerity of the conventionally shunned one. *Boule de Suif* is the acknowledged masterpiece founded on such a contrast, and the *House of Tellier* is also created out of the meeting of the conventional and the unconventional.

Essential to Maupassant's form is his objectivity. His characters are known through their appearance and action. Their motives are not analyzed, and the inner recesses of their minds are not probed. Maupassant had contempt for analytical fiction, which he declared in his preface to *Pierre and Jean* to be "composed after the manner of the philosopher writing a book on psychology." The objective writer is the true realist, for he knows that "psychology ought to be concealed in a book, as it is concealed in reality, beneath the facts of existence." Thus, in his stories he naturally achieved the brevity and concrete portrayal essential to the form, while the Victorian English writers fumbled in handling the short story because they could neither reduce the luxuriant verbiage nor sharpen the leisurely style fostered by their huge novels.

Also because of his objectivity, plot appears to dominate Maupassant's stories. The true nature of his illusory realism was soon ignored, largely because it was too personal to be imitated. However, the sheer plot-technique proved easily applicable. In America, this technique was studied by Henry Cuyler Bunner (1855–1896), whose *Made in France* is a collection of deliberate paraphrases of Maupassant's stories given a Yankee twist, further complications of plot, and the intensified surprise-ending. In this way, certain elements of Poe's technique returned to exert force upon the American short story, finally producing a writer who attained a national popularity beyond that of any other short-story writer—O. Henry (William Sydney Porter, 1862–1910).

Also, the American short story had received a strong impetus from Bret Harte (1839[1]–1902), who had combined certain elements of the Poe-Maupassant technique with a theme from Dickens: beneath that rough exterior there beats a heart of gold. After the notoriety gained by *The Luck of the Roaring Camp* (q.v.), Harte exploited both the formula and the latent sentimentalism of this theme. His superficial realism, sentimentalism, and arresting plots were a winning combination, and it is little wonder that his influence was great.

Realism came falteringly to American fiction in devious ways. First it appeared in the form of the kind of indigenous humor immortalized by Mark Twain (Samuel Langhorne Clemens, 1835–1910), who in at least one story, *The Man That Corrupted Hadleyburg* achieved a perfect blending of tragedy and comedy without either the sentimentalism of Harte or the sensationalism of Maupassant. Too, imported realism had an iconoclastic vogue in the 1870's, when translations of Ivan Turgenev began to appear in American magazines.

Essentially, however, a serious realism came to the American short story, not as a literary creed, but as the writer's conviction that he had a moral obligation to tell the truth about the particular section of the country with which he was intimately associated. Local color had been used quite naturally by writers such as Harriet Beecher Stowe (1811–1896), Sarah Orne Jewett (1849–1909), and George Washington Cable (1844–1925), and it was employed with technical deliberateness by Bret Harte. It served Mary E. Wilkins Freeman (1852–1930) in her depiction of the less romantic aspects of New England life; and in Hamlin Garland (1860–1940) it became a means to call attention to the farmer's struggle for existence in the stricken Middle West. Although a new kind of social didacticism thus

[1] Some authorities give birth date as 1836 and 1839.

entered the short story, concreteness of portrayal was furthered.

An inevitable product of realism in the short story was impressionism, the rendering of immediate sense impression. With his insistence upon compression and effect, Poe had provided the foundation for impressionism, but because in his own stories he was intent upon evoking an emotional response, he had little interest in providing the graphic detail necessary to sense impression. Under the influence of realism, however, writers turned to the problem of achieving immediacy of sense-objects. Instead of presenting an object as a whole, the impressionist depicts only its most suggestive physical details. His chief device is compressed imagery that evokes in the reader a reaction to the physical properties even before it results in a complete picture of the object. Because of its swiftness of description and the immediacy of object in which it results, impressionism is admirably suited to the short-story form.

The stories of both Ambrose Bierce (1842–?1914) and Stephen Crane (1871–1900) contain well-developed impressionism, but the bitter irony of these writers prevented their becoming forces of influence. Chiefly they point to the future, Bierce anticipating William Faulkner (Falkner, 1897–), and Crane, especially in style, foreshadowing Ernest Hemingway (1898–). Significantly, these early impressionists were newspaper men. Journalism, with its emphasis upon concrete, brief, and arresting reporting, influenced the short story near the end of the 19th century, as the perfection of motion pictures was to suggest new devices for swiftness of portrayal to 20th century writers.

In the end, however, it was not undiluted realism that triumphed, but realism mixed with romanticism and sentimentalism. Robert Louis Stevenson (1850–1894) had continued the romantic tradition, and even such self-styled realists as Frank Norris (1870–1902) and Jack London (1876–1916) are revealed as romanticists when set against Stephen Crane. The great summation of these diverse tendencies is the stories of Rudyard Kipling (1865–1936), the first influential English short-story writer of the modern period. Kipling borrowed promiscuously, but the resulting blend was so perfectly proportioned that it carried the mark of powerful originality. His stories in *Plain Tales from the Hills* (q.v.) reveal the technical devices of Poe, the sentimentalism of Harte, the realism of Maupassant, an impressionistic method of description developed by his own experience in journalism, and, finally, the romanticized Indian setting. So potent was this combination that practically all writers were attempting Kiplingized stories before the turn of the century.

Genuine realism was thus retarded, but its technical lessons were retained. The means to achieve immediacy of object were known at last to all writers and applied to all types of subject matter. Technically, the short story had advanced as far as it could go in one direction. Boundless imitation of the old would have been inevitable had writers not become aware that in Russia had arisen a new form of storytelling.

New Technicians.—From the time of Nikolai (Vasilievich) Gogol (1809–1852), Russian realism never portrayed merely the external world, but included the psychological moment as a natural datum of existence. This is apparent in the *Sportsman's Sketches* of Ivan (Sergeyevich) Turgenev (1818–1883), and is a distinguishing mark of the great novels of Leo Tolstoy (1828–1910) and of Fydor Dostoyevsky (1821–1881). When in fiction a thought is allowed a significance equal to that of a physical action, there is necessarily a lessening of formal plot. Both these novelists wrote a few stories exhibiting this kind of realism, but it was left to Anton (Pavlovich) Chekhov (1860–1904) to perfect from it a short-story form.

Chekhov was by temperament an objective, yet compassionate, artist. As a result of this, as well as of the tradition of realism to which he fell heir, he wrote stories which at first seemed revolutionary in their lack of technique. However, upon translation, the same stories incited so many attempts "in the Chekhov manner," among English and American writers that the presence of applicable technique was clearly demonstrated.

Chekhov was a versatile writer, but his unique contribution is the story in which, according to the popular description, "nothing ever happens." For an understanding of his technique, it is instructive to compare his story *The Schoolmistress* with Maupassant's *Miss Harriet.* Both stories portray the lives of frustrated and futile spinsters. Through brief description of Miss Harriet's appearance and references to her past, Maupassant makes explicit the restricted nature of her life, as well as the fact that her present religious fanaticism is merely a perversion of repressed normal tendencies. She falls in love with the young painter who has been friendly to her out of curiosity, and she commits suicide in recognition of the futility of her passion. In tribute to her wasted life, the painter kisses the lips of the corpse.

Except for a few impressionistic details, Chekhov does not describe his Schoolmistress. The latter thinks briefly upon her past, but not upon momentous forces or events. She is no fanatic, and she holds a casual conversation with the wealthy, attractive gentleman she meets on the road back from town. A chain of thought causes her to think fleetingly of her life had she been his wife, but she is not in love with him. She rides on, arguing with some peasants, and again seeing the man as she draws up to a railroad crossing. That is all. Instead of plot, this is a candid-camera shot of a representative moment. By seeing it, the reader becomes aware of the *essence* of this particular life, and, through that, of the *typical* nature of that life.

Chekhov's technique is thus one of abstraction and implication. He abstracts from the individual what is most representative, and by this he implies the universal. The process of abstraction guides his choice of scene and dialogue, both of which are likely to appear aimless and casual, because it is seldom the significant incident or the directed conversation that is representative. By this means, Chekhov (with the help of the reader) overcomes spatial limitations while yet retaining immediacy of object through graphic portrayal of the individual. To call Chekhov a less skillful craftsman than Maupassant is simply to state preference for a certain kind of story.

Katherine Mansfield (Katherine Middleton Murry, *nee* Kathleen Beauchamp, 1888–1923) was the first short-story writer to make direct application of Chekhov's technique. She was even more precise in the process of abstraction, and her impressionism gives greater concreteness

to the depiction of the chosen moment. Too, her implications are often helped by concrete symbolism, such as the pear tree in *Bliss*. At their best, her stories are as intense in their connotations as their surface pictures (*The Fly,* for example), and they convey a sense of the inevitable. Because, however, she believed that every moment was equally representative, some of her stories naturally lack this intensity. In all instances, she wrote with precision, strictly adhering to her abstract form. "I feel as fastidious as though I wrote with acid," she once explained in refusing to cut a single line from a finished story.

Although the stories of Joseph Conrad (1857–1924), John Galsworthy (1867–1933), Arnold Bennett (1867–1931), William Somerset Maugham (1874–), and Stephen Vincent Benét (1898–1943) continued to exhibit the fine craftsmanship of the older traditions, more experimental writers were attracted to the new technique. James Joyce's only volume of short stories, *Dubliners,* fell in 1914 upon an unheeding world, but it represents a stage in the evolving concept of what makes a story. Scenes connected only by the slender unity indicated by the title of the collection are substituted for formal plot.

Five years after *Dubliners,* Sherwood Anderson's *Winesburg, Ohio* appeared, revealing the same lack of formal plot. With Anderson (1876–1941), the new technique entered the American story almost in disguise. In such a story as *I'm a Fool,* there is the sound of the story-teller's voice spinning a rambling yarn, yet there is no more yarn than in Chekhov, and the rambling is artful. The process was completed by Ernest Hemingway, who told stories in the Chekhov manner with such simplicity of style that even greater concreteness was secured. To ensure the reader's reaction to the object presented rather than to the writer's emotion, Hemingway pared off as much as possible the intellectual nature of words.

When writers were relieved of the spatial restrictions of formal plot, they were free to give to the short story a more significant content than it had ever before received. Also, writers as varied in attitude and style as Thomas Wolfe (1900–1938), Erskine Caldwell (1903–), James T. Farrell (1904–), John (Henry) O'Hara (1905–), William Saroyan (1908–), and Katherine Anne Porter (1894–) could apply the technique of abstraction and implication, and yet retain high degrees of individuality.

Throughout the rapid development of the short story which has taken place since the time of Poe, the broad premise of Poe's technique has been retained, for the short story must always aim at singleness and totality of effect. It is not strange that the course of this development, through realism, impressionism, and abstractionism, should parallel that of painting, for the two forms exist within similar spatial boundaries. As painting had to evolve ways to escape being merely photographic reproduction, the short story confronted the necessity of preserving concreteness of portrayal while suggesting more than is portrayed. It is this conscious search for technique that makes the short story something more than mere anecdote or skeletal novel.

RUBY V. REDINGER,
Assistant Professor of English, Fenn College, Cleveland, Ohio.

SHORTER, Clement King, English editor: b. London July 19, 1857; d. Great Missenden, England, Nov. 19, 1926. He was in the Civil Service from 1877 to 1890, when he began editorial work and was editor of the *Illustrated London News* from 1891 to 1900; founded *The Sketch* (1893) and edited it for seven years; also during the same period editing the *English Illustrated Magazine.* After 1900 he was editor of *The Sphere.* His Brontë studies are notable contributions to English literature and include *Charlotte Brontë and Her Circle* (1896); *Charlotte Brontë and Her Sisters* (1905); *The Brontës: Life and Letters* (2 vols. 1907); among his other works are *Sixty Years of Victorian Literature* (1897); *Immortal Memories* (1907); *Napoleon in his Own Defence* (1910); *George Borrow and his Circle* (1913); *C. K. S., an Autobiography* (1926).

SHORTER CATECHISM, a catechism extensively used by English-speaking Presbyterians throughout the world, and which was framed during the time of the English Commonwealth. A committee of assembly was appointed Aug. 5, 1647 to prepare the Shorter Catechism, which was presented to the English Parliament November 26, that year, and was ordered to be printed by vote of Parliament, April 16, 1648. The Scottish general assembly adopted the catechism July 16, 1648, and the Scottish Parliament the following February ratified this action. See CATECHISM.

SHORTHAND has often been defined as the art of writing as fast as a man speaks. The Standard Dictionary definition is better: Shorthand — any system of handwriting that reduces the number of muscular movements required to present words and sentences in graphic outline . . . opposed to longhand. The former definition applies with accuracy only to the most highly developed phase of shorthand — verbatim reporting — applies with much less force to the enormously larger field of business office stenography and ignores the largest and most important potential field of shorthand — shorthand for general personal (nonprofessional) use.

Four Principal Characteristics.—The shortness of shorthand as compared with longhand is due to four principal factors:

1. Shorthand writes by sound, ignoring the eccentricities of common spelling. This feature alone would, even though each letter of shorthand averaged as long as the letters of longhand, save 15 per cent of time and effort directly, by eliminating superfluous letters, and still more indirectly, by eliminating the mental hesitation involved in following the inconsistencies of common spelling.

2. Shorthand uses for its basic alphabet the simplest signs which its inventor can devise or adapt — seldom averaging more than 1.1 strokes per letter, as compared with about four strokes per letter for longhand as usually analyzed. This feature alone does not, as might first appear, save as much as 75 per cent of the labor of writing, for the letters of longhand are so devised as to join with each other in any order with no appreciable modification of form, direction or position relative to the line of writing — a condition conducive to the highest speed of automatic action and impossible to duplicate fully in any shorthand.

3. Shorthand, by various devices such as the position of strokes relative to the line of writing or to each other, or modifications of length or shading, or initial or final circles, hooks or loops, known as appendages, gives to a single stroke a multiple significance, so that in Pitmanic shorthand, for example, the sign ↘ expresses or implies by logically related rules every one of the six consonants of the word *sprints* in their proper order.

4. Shorthand abbreviates words or phrases much as in longhand, expressing or implying only so many of the sounds as will serve to identify the words written. This is carried to a high degree requiring careful memorization in certain forms for common words, known as wordsigns, and is sometimes carried still further by arbitrary or exceptional use of dots or ticks for particular words, such outlines being known as arbitraries.

Number of Systems.—In the absence of fixed standards of measurement or clear determination of fundamental principles (see SHORTHAND SCIENCE OF) more than a thousand dif-

ferent systems of shorthand have been published for English alone — a confusion unparalleled since Babel. Fortunately at least nine-tenths of these are of historic interest only to-day, while the remainder may be grouped in a comparatively few more or less well-defined classes.

Three Distinct Styles.— No intelligent answer can be given to the first question of the layman: "Which is the best system of shorthand?" without recognizing that there are three distinct broadly marked fields of shorthand use which may be designated as reporting, business and personal — related, to be sure, but each with its own peculiar problems.

A reporting style of shorthand must use all practicable shorthand devices to their fullest extent with effective (legible) speed, the paramount consideration, attaining a speed from 150 words per minute up to the highest yet achieved, between 280 and 300 words per minute. Such a style will be used for court reporting, legislative reporting, speeches, conventions and in general all verbatim reporting purposes, where the speaker ignores the reporter. Mastery of a reporting style requires long and arduous professional training extending over a period of several years, and commands rewards proportionate to the effort required. The most competent estimates place the total number of verbatim reporters in the United States under 5,000.

A business style of shorthand must use abbreviating devices to some extent but must maintain positive legibility and reasonable simplicity even at the expense of speed, attaining speeds from 90 to 150 words per minute. Such a style will be used chiefly for business office dictation of correspondence, numerically much the largest field of shorthand to-day. Reasonable mastery of a business style is afforded by the average six months' business school course involving about 300 hours' study. Though the 1910 census shows only about 330,000 professional users of shorthand or typewriting, there are undoubtedly to-day (1919) at least 500,000 stenographers or business style shorthand writers in the United States.

A personal style of shorthand must make phonetic correctness and completeness and simplicity the paramount considerations, attaining speeds from 60 to 100 words per minute. Such a style will be used for personal correspondence, by professional writers or speakers for original composition, for lecture notes, abstracts, memoranda and potentially for all purposes of longhand. No system not particularly designed for such personal style use can be mastered to the point of even 60 words per minute speed in less than 100 hours by the average student. Considering the enormous potential value of shorthand for general personal use — the goal and vision of shorthand inventors for centuries — the number of personal style, non-professional, shorthand writers is pitifully small — a condition for which the futile effort to make business style and reporting style shorthand systems serve this distinctive field is chiefly responsible. Each of these three styles has its own problems and its own field, and in each field at the present time a fundamentally different type of system is most prominent.

Reporting.— In the reporting field to-day Pitmanic shorthand is dominant, despite the most strenuous efforts of competing systems of other types. A recent census of the National Shorthand Reporters' Association indicates that 91 per cent of its membership write some form of Pitmanic shorthand.

Business.— In the business field an entirely different type of system, often miscalled "script" shorthand, of which the principal American representative is Gregg shorthand, has recently achieved a marked predominance. A recent questionnaire sent out by the National Educational Association to over 11,000 schools, and eliciting over 3,000 replies, indicates that 67 per cent of all schools, public or private, teaching shorthand (which in at least 99 per cent of all cases means business style shorthand) are teaching Gregg shorthand.

Personal.— In the personal style field no accurate statistics are possible, largely owing to the lack of true personal style systems The nearest approach to a distinctive and rational personal style system in the past was Lindsley's Takigrafy, which attained considerable prominence during the last one-third of the 19th century, but has to-day largely disappeared. The only system alive to-day particularly designed to meet the exacting but little understood requirements of general personal use, in accord with the science of shorthand, is Personal Shorthand (Dewey), which is still too new to justify further comment at this time.

Pitmanic Shorthand Characteristics.— All Pitmanic shorthand is based on the original invention and subsequent modifications of Sir Isaac Pitman (1813–97), justly styled the father of modern shorthand. The distinctive characteristics of all Pitmanic systems include (see also comparative alphabets and specimens following):

(1) Detached vowel-group signs which are distinguished by the position in which they are written relative to the consonant stems. (2) A primary consonant alphabet of 24 stems, of which 21 are alike in all Pitmanic systems, composed of straight lines and circular curves, written on four different slopes and of two thicknesses (shading), but of one uniform length. (3) A secondary consonant alphabet of appendages, circles, hooks and loops, used under various conditions for alternative expression of the more common consonants, supplemented by further devices such as writing consonant stems one-half or double their normal length to imply other additional consonants, or writing outlines above, on or below the normal line of writing to indicate that an omitted vowel is one of a particular group.

Pitmanic Variations.— Of the many variant forms of Pitmanic shorthand which have been published, the Benn Pitman, Graham, Isaac Pitman and Munson are the most important in the United States, ranking in that order of numerical strength. In Great Britain, under more stringent copyright protection, the parent Isaac Pitman system is dominant, but in this country it is altogether secondary to the dominant Benn Pitman and closely related Graham.

The principal differences between the leading Pitmanic systems are: (1) Three conso-

nants, w y h, which are written: Benn Pitman, Graham, Isaac Pitman, Munson. (2) The relative positions of two pair of the dot vowels which are written

Benn Pitman, Graham, i ɪ a ɑ

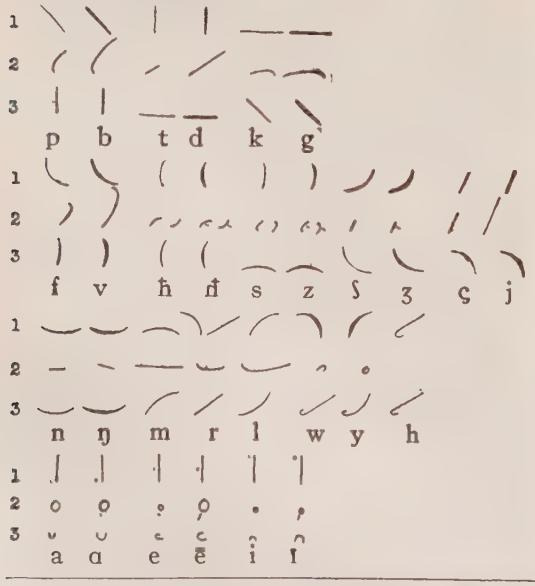
Isaac Pitman, Munson, a ɑ i ɪ

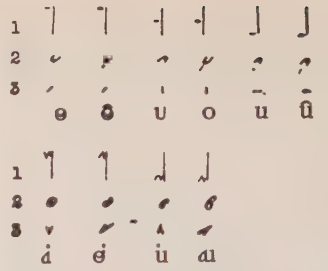
(3) Various minor details, especially with regard to the writing of small and large hooks on consonant stems.

Gregg Shorthand Characteristics.— The distinctive characteristics of Gregg shorthand include: (1) Joined vowel-group signs which are distinguished by detached diacritic marks; (2) A consonant alphabet composed of straight lines and elliptic curves, written on only two slopes and of only one thickness (non-shading); but of three lengths. (3) Conspicuous absence of those compound consonant devices which add complication on the one hand and power on the other in Pitmanic shorthand.

Personal Shorthand Characteristics.—The distinctive characteristics of personal shorthand include: (1) Joined vowel signs explicit without further distinction; (2) a consonant alphabet of straight lines and curves, written on four slopes, of two thicknesses (shading), and of one length; (3) compound consonant signs designed and used primarily for the true consonant compounds of English, especially those which occur before the vowel of their syllable.

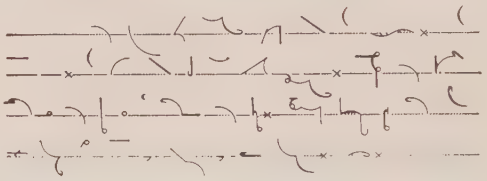
Comparative Alphabets.—The table following gives the basic alphabets of the three systems reviewed as most representative of the three styles of shorthand to be distinguished. The sounds of the shorthand signs are keyed by the N E A alphabet* (see PHONETICS), used as Key 1 of the New Standard Dictionary and its abridgments, the only phonetic key suitable for general popular use in English. (1) Benn Pitman Phonography; (2) Gregg Shorthand; (3) Personal Shorthand.



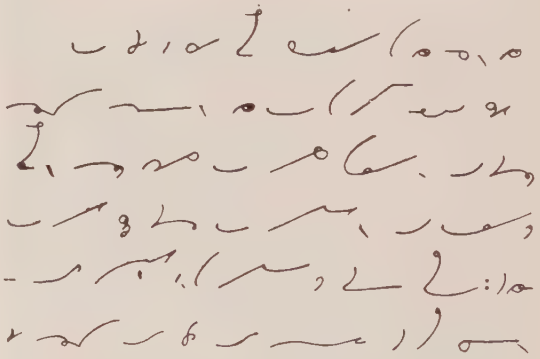


Comparative Specimens.— The specimens following give a familiar selection, the Lord's Prayer (Matt. vi, 9–13), in the reporting style of Benn Pitman Phonography, the business style of Gregg Shorthand, and the personal style of Personal Shorthand.

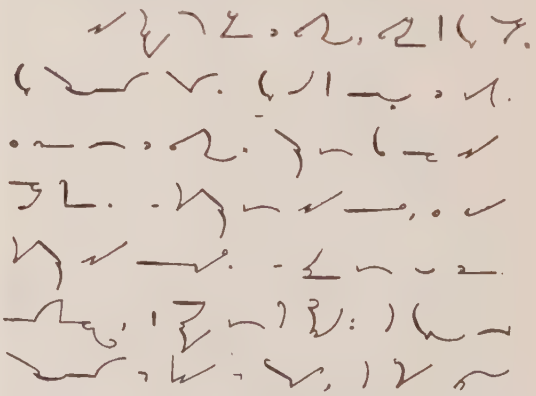
Benn Pitman Phonography reporting style



Gregg Shorthand business style



Personal Shorthand personal style



The best system of shorthand or the best style of a particular system is that style or system which best meets the requirements of the writer. The shortness and complexity of

*The type actually used to key the shorthand alphabets below is a simplification of the N E A alphabet by the author in harmony with shorthand practice.

a true reporting style is altogether unsuitable for general personal use. The simplicity and fulness of a true personal style is altogether impossible for reporting practice. The unsuitability of a business style for reporting or personal use differs nowise in kind but only in degree.

GODFREY DEWEY,
New York State Shorthand Reporters' Association.

SHORTHAND, History of. The early history of this art is closely allied with palæography, and it has been traced into the mists of antiquity. Antiquarians have tried to connect it with hieroglyphics and to show that it was used more than 1,000 years before Christ by the Persians, Egyptians and Hebrews. Abbreviated writing, to take down lectures and also for the preservation of poems recited at the Pythean, Nemean and Olympic games, was practised by the early Greeks, and there are specimens of ancient Greek *notæ,* or shorthand, in the Vatican Library, at Rome, the Bibliothèque Nationale, at Paris, and the British Museum.

Ancient History.—The definite existence of shorthand reporting dates in the century preceding the Christian era. Tiro, the accomplished freedman and amanuensis of Cicero, was in 63 B.C. the first known practitioner of the art. He reported speeches of his master, which were afterward revised by the orator; and as *notæ Tironianæ* became the established name for shorthand writing its invention was subsequently ascribed to him. At that period Rome was drawing from Greece her stores of learning and art, and Tiro's system was probably an adaptation from the Greek. Plutarch informs us in his life of Cato the Younger that Cicero distributed notarii (shorthand reporters) in various parts of the Senate House on the occasion of the vote as to the fate of Catiline, the chief purpose being to take down the speeches of Cæsar and Cato. The text of those speeches may be given by Sallust in his history of the Catilinian conspiracy, chapters 51–53, or the historian may have followed the example of Thucydides and embodied in them his conception of the character and policy of the two foremost senators. Mæcenas, the famous statesman, courtier and patron of literature, introduced some improvements in shorthand, and, according to Dion Cassius, instructed many in the art through his freedman Aquila. Seneca afterward increased the number of notations to a total of 5,000. Scalinger made a collection of the notes of Tiro, Seneca and others, which is appended to the great work of Janus Gruterus, published at Heidelberg, in 1603.

An illustrious German scholar, Ulrich, in 1817 analyzed the Tironian notes and his analysis shows that Roman shorthand, though a strain on the memory, answered the practical purposes of stenography quite as well as the systems in vogue in the early part of the 19th century, such, for example, as the one sketched by Charles Dickens from his own experience in the 38th chapter of 'David Copperfield.' We are informed by Suetonius that the Emperor Augustus taught the art to his grandchildren and that the Emperor Titus was a skilful stenographer. Martial, who lived in the time of Nero, has left an epigram upon a shorthand writer: *Currant verba licet, manus est velocior illis.* Among ancient papyri discovered 100 miles south of Cairo in 1903 by Professors Grenfell and Hunt, there is a contract with a writer of tachygraphy, made 137 A.B., whereby a slave boy was to be taught shorthand for 120 drachmæ ($24); 40 drachmæ were to be paid down, 40 more on satisfactory evidence of the progress of the boy and the last 40 when he had become proficient.

Shorthand seems to have been much used by the early Christians. It is supposed that Saint Paul dictated to amanuenses several of his epistles, notably that to the Colossians, where Tychicus acted as shorthand writer and Onesimus as transcriber. We know that Origen in the 3d century was assisted in the preparation of his 'Commentaries on the Scriptures' by clerks who wrote in shorthand from his dictation. Saint Augustine refers to an episcopal assemblage held at Carthage late in the 4th century, at which eight stenographers were employed in relays of two. About the same period the poet Ausonius praised a youth who could write faster than his master could dictate, and, with poetic license, even faster than he could think; and in another poem expressed his admiration of the skill of the stenographers of the time. Charlemagne, king of the Franks for 46 years and likewise Roman emperor during the 14 years preceding his death in 814, possessing an amount of learning unusual in his age, endeavored to become proficient in writing Tironian notes. But the *lingua Latina* was fast giving place to the *lingua Romana,* from which the modern Romanic languages of Europe sprang. At the Council of Rheims in 813, priests were admonished to address the people in the rustic tongue. Nor was a knowledge of the art confined to the Western civilization. A translation by Professor Flügel, of Dresden, from the Arabic, narrates how a Chinese in 923 A.D., who had acquired Arabic speech and writing in less than five months, took down in shorthand from the lips of his teachers 16 books of Galen.

Modern History.— The first modern shorthand work was printed in London in 1588 and dedicated by its author, Dr. Timothy Bright, to Queen Elizabeth. The first French publication, that of Jacques Cossard, appeared in 1651. The oldest German system was published in 1679. Gurney's is the oldest living system of English shorthand. It was first issued by Mason in 1672 and improved by Thomas Gurney in 1750. Taylor's system appeared in 1786, subsequent editions of which bore the name of Odell, Harding and so on. This system has a remarkable history of successful adaptation to Continental languages. Bertin adapted it to the French and Danzar in 1801 adapted it to the German language. Marti's tachygraphy was an adaptation of Taylor's alphabet to the Spanish language and was first published in 1800. By a royal ordinance in 1802 a chair for shorthand was established in the university at Madrid and Marti named as professor. The cortes of Cadiz first had an official shorthand report of its proceedings in 1810. Marti's tachygraphy was in 1828 applied to the Italian language by his son, who also adapted it to the Portuguese. Pereira had also, early in the century, adapted Taylor's alphabet to the Portuguese. The intro-

duction of shorthand into Mexico and the countries of South America followed these adaptations. Amanti, an Italian, adapted Taylor's shorthand to his own language and as modified by Delpino it is now used by the official corps of the Chamber of Deputies. The three prevailing French systems are those of Prevost, Duploye and Prépéan, the first named being a modification of Taylor. It is estimated that the bibliography of shorthand comprises 16,000 volumes, exclusive of reissues or editions. A valuable contribution to the English branch of this subject has been made by Julius Ensign Rockwell, published by the government as Circular of Information No. 2, Bureau of Education, Washington (1884), and Circular No. 1 (1893). The latter contains a reproduction of 112 English shorthand alphabets, extending from the first alphabetic system, that of Willis, in 1602, to the Duployan method adapted by Pernin in 1882. In 1888 'Light Line Phonography,' issued later as 'Gregg Shorthand,' was introduced.

A court of law in England in 1740 took the initial step in appointing an official shorthand writer. The next instance of the public recognition of shorthand in that country occurred in 1789, when the House of Commons, during the trial of Warren Hastings, called the shorthand writer to the bar and required him to read from his notes the exact words used by Mr. Burke, and thereupon resolved that Mr. Burke had exceeded his instructions in accusing Sir Elijah Impey of murder. The publication of Hansard's Debates was begun in 1803 and has become a general system of reports of representative bodies in Great Britain and her colonies. It is compiled from newspaper reports, supplemented by special reports. This system is closely followed in some of the colonies, as in New Zealand, while a method similar to that pursued by our national legislature has been adopted by the Canadian Parliament. The Hansard's report is semi-official, the speeches being submitted to members for revision and it is subsidized by the House of Commons. The official shorthand writing for the British Parliament is confined to the committee reporting, in which Pitman's and Gurney's systems have long had governmental recognition.

A census taken in 1914 of the systems of shorthand used in the Press Gallery of the British Parliament showed that out of 137 writers 128 wrote the Pitman system, 4 the Taylor system, 2 the Gurney system and 3 the Sloan-Duployan system.

The American colonies were not far behind the mother country in the use of shorthand. The Virginia Convention of 1788, called to deliberate on the ratification of the Constitution of the United States, was reported in shorthand in a meritorious manner by David Robertson, of Petersburg, Va., and in 1903 the National Shorthand Reporters' Association of the United States erected a tablet in Saint Augustine's Church, Philadelphia, to the memory of Thomas Lloyd, the official reporter of the National House of Representatives, 1st session 1st Congress. This tablet bears the following inscription:

Captain Thomas Lloyd, Author, Soldier, Patriot.
The father of American shorthand reporting.
14 August 1756 — 19 January 1827.

In 1834 Franz Xavier Gabelsberger, secretary to the Ministry in Bavaria, brought out his invention and in 1837 Isaac Pitman, of Bath, England, gave to the world the first edition of phonography or sound hand. Gabelsberger's system, with adapatation, has been widely introduced in Austra-Hungary, Switzerland, Russia, Denmark, Norway, Sweden, Finland, Poland, Holland, Belgium, Serbia and Rumania, although in some of these countries modifications of the Stolzean method predominate. Wilhelm Stolze published his system in 1841 and it is used in the Prussian Chamber, which is the sole exception to the official use of Gabelsberger's shorthand in Germany. In Russia a translation of Gabelsberger is officially employed in the imperial Senate, the Court of Cassation and other law courts. There was, of course, a gradual development of the art down to Isaac Pitman's invention. Dr. Bright's system was cumbrous and followed the vertical style of Chinese writing; but he indicated a present particle by two final dots just as Isaac Pitman nearly three centuries afterward denoted it by one.

Phonetics.— The phonetic principle was first applied to English shorthand by John Willis, in 1602, and it was further developed from time to time; but it remained for Isaac Pitman to make it a complete basis; in other words, to invent phonography or sound hand. As there are in the English language 43 distinct sounds, represented by 26 letters, Isaac Pitman adopted an extended alphabet by which consonants are indicated by simple geometrical strokes, straight or curved, the light sounds denoted by light strokes and the heavy ones by corresponding heavy strokes. The leading heavy vowels are represented by six heavy dots and a like number of heavy dashes, placed at the beginning, middle or end of the strokes and before or after as they precede or follow the consonants. The same course is followed with the light vowels. Diphthongs are provided for by a combination of dash forms and by a small semicircle differently formed and placed in different positions. Circles, hooks and loops are employed in distinct offices. As an illustration, the word *bought* is composed of three sounds represented by six letters. It is spelled phonetically *b aw t,* and in phonography it is written with two straight strokes joined, one sloping and the other perpendicular and a disjoined dash. In rapid writing the dash is omitted, as an important feature of the art in reporting is the use of consonant outlines, omitting vowels. It follows that shorthand is more readily adapted to a consonantal than a vowel language and for this reason French is easy and Japanese difficult. In every case, however, many brief forms, more or less arbitrary, are used for words of frequent occurrence.

Pitman System.— As has been stated, verbatim reporting in the English-speaking world dates from the invention of phonography by Sir Isaac Pitman. In recognition of his eminent service, the honor of knighthood was conferred on him by Queen Victoria. There was a celebration in London in 1887 known as the Golden Jubilee of Phonography, in which an array of talent was displayed which came as a surprise to men of letters on both sides of the Atlantic, who were unaware of the accomplishments nec-

essary to make the career of a shorthand reporter successful. Sir Isaac died in 1897, after having witnessed the introduction of phonography into every land that Anglo-Saxon civilization has penetrated. The inventor received great aid from his brothers, but that of his youngest brother was conspicuous and American. Benn Pitman came to the United States in 1853 and established in Cincinnati a phonographic institute and a publishing house, which are still in successful operation. For many years Pitman had an able associate in the person of Jerome B. Howard. In 1903 Benn Pitman having spent 50 years in the dissemination and development in the United States of his brother's invention, the National Shorthand Association, which met in Cincinnati, made an appropriate celebration of the golden jubilee of his labors.

The following is the complete alphabet of the Isaac Pitman system as presented in «Course in Isaac Pitman Shortland» (1918).

THE PHONOGRAPHIC ALPHABET.

DIPHTHONGS. I OW OI U

To these brief elementary signs, which represent every distinct elementary sound in English, are added abbreviating adjuncts and principles that enable the hand to keep pace with thought. When Isaac Pitman invented his shorthand alphabet and with the assistance of distinguished educators and practitioners improved it, he had a three-fold object in view:

1. To give those who had memoranda to make, a more elementary method of writing, plain, simple, easily acquired in a few weeks, and capable of being executed at the rate of 50 or 60 words a minute.

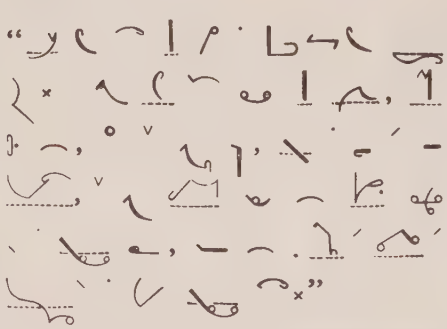
2. To develop a style of writing for the use of business men, ministers, physicians, authors, scientific investigators, and others who would acquire through a few months' study the ability to write 100 words per minute, with the ease of speech and the legibility of print.

3. To establish a system of reporting for those who sought to record the eloquent orations of public speakers at the rate of 300 words a minute when required.

How well the inventor succeeded in his realization of these first two resolves may be seen in the representation in the next column and the history of the dissemination of the art proves that this third has also been crowned with success.

Pitman's phonography has not only been successfully adapted to such languages as the Spanish and Dutch, but even to the Malagasy for official used in Madagascar, and in 1902 Edward Gantlett made an adaptation to the Japanese language under the title ‹Phonographica Japonica.› In Japan and China a method of tachygraphy is generally employed. The separate marks which united form a character in ordinary writing are made by a single stroke of the pen, the contours being traced regardless of details. In India, Navina, of the Punjab University, invented an alphabet of new Hindu characters, which is said to form the basis of a rapid and legible system of shortland. Other systems, based on Isaac Pitman's, have been introduced in the United States by Elias Longley, Andrew J. Graham and James E. Munson. Mr. Graham brought out the first edition of his ‹Standard Phonography› in 1858.

SPECIMEN OF ISAAC PITMAN SHORTHAND.



"I wish every man had such an education—every young man especially. And if either of my sons had lived, and I had trained him, as I should have tried to do, to be a great and good farmer, I should have wanted to send him at least six months to a Business School, to give him the aptitude and habits and forms of a thorough Business Man."

Horace Greeley.

Official Use.— The enlarged use of shorthand, owing to the demands of State legislatures, courts and the business world, is well known. The National Shorthand Reporters' Association has an executive committee composed of reporters from 35 States, 2 Territories and the District of Columbia. (See SHORTHAND STANDARDIZATION). The Senate of the United States in 1848 made a contract for a verbatim report of its debates and proceedings and the same course was adopted by the House of Representatives in the following year. Before 1848 the *Congressional Globe* contained an abstract of the debates and such speeches in full as members wrote or had specially reported. In 1873 Congress adopted the existing method and transferred the official publication of the proceedings from private contract to the government printing office. By this method each house employs a corps of five

reporters, the Senate paying to its corps $25,000 a year and the reporters of the House receiving $5,000 a year each. In addition, the House of Representatives employs a corps of official reporters of committees.

Shorthand has reached the highest possible development in every country where a parliamentary form of government has obtained. Turkey possessed no system of shorthand until her accession to the list of constitutional states, brought about by the reform movement of 1876. The Turkish Parliament met in 1877 and much difficulty was found in securing reports. Stenographers were employed to translate on the spot into French the speeches delivered in Turkish, but in this work the note-takers failed. The speakers were then required to reduce their remarks to writing before delivery; but it was found that such a rule could not be applied to a deliberative body. Efforts were then made to invent a stenographic machine, but this proved a failure there as elsewhere. Gabelsberger's system subsequently was translated into Turkish by Grünbaum.

The Continental countries of Europe, Great Britain and the United States now make instruction in shorthand a material and essential part of education.

CLARENCE A. PITMAN.

SHORTHAND, Science of. Shorthand Empiric.— Modern shorthand has developed from the earliest times down almost to the present day wholly as an empiric art, lacking those standards of measurement and accompanying definition of terms which constitute the first essential of any science — a striking anomaly in this scientific age.

Resultant Confusion.— As a direct consequence of this condition more than a thousand different systems of shorthand have been published for English alone, which for longhand has in effect but one. No less striking is the fact that those systems most prominent in the United States to-day differ not only in their specific alphabets and outlines and minor rules but also in their most fundamental conceptions of the nature and use of shorthand material — differences as marked as though the steam railroads of the country should run on one rail or three while the electric rapid transit of the cities ran on two.

Controversial Data.— This lack of recognition of scientific principles which, recognized or not, must underlie the practice of any useful art, has developed an immense mass of controversial literature, in which system A is compared with systems B and C, or system X with systems Y and Z, always to the latter's disadvantage — each document conclusive and final in itself, but each directly and irreconcilably contradictory to the other. The inevitable result of this futile recrimination has been to increase rather than decrease confusion and strife, and to make organized scientific progress impossible.

Efforts to Formulate Science.— Various attempts have been made in the past to determine the basic principles which, systematically related, constitute the science of shorthand as distinct from the practice of the art. Of these, the most noteworthy was the formation of The Shorthand Society in London in 1881, with the avowed purpose of "the study of the science and literature of shorthand and the investigation and discussion of the principles which should govern the construction of systems of shorthand and abbreviated longhand, adapted, if possible, for general use." The transactions of this society (50 numbers of the magazine *Shorthand*), which lasted for a dozen years till disrupted by the factional strife of system partisans, contain many sincere efforts to establish such basic general principles of shorthand — unfortunately in most cases too specific in their application to particular types of systems to have the general value for which they strove.

The outstanding feature of the society's efforts is undoubtedly the work of Edwin Guest, 1836–1919) which reached the point of propounding and roughly grouping 49 genuinely single and separate propositions and definitions under the general head of "Shorthand principles worthy of general acceptation," before further organized progress was suspended by the disintegration of the society.

Equally able and sincere though less detailed is the notable paper of Prof. J. D. Everett, "On the principles that govern the construction of a system of shorthand," read before the 1887 International Shorthand Congress at London. Various other statements have been put forth in the name of shorthand science, but with rare and fragmentary exceptions they prove on examination to be at best a list of unsubstantiated personal opinions, at worst a catalogue of personal prejudices.

Science of Shorthand.— The science of shorthand, presented before the 1918 convention of the New York State Shorthand Reporters Association, the oldest shorthand organization of America, as a part of the work of the Committee on Shorthand Standards marks the first systematically comprehensive formulation of the fundamental principles of shorthand science. It is an attempt to classify, define and where necessary discuss the single separate factors involved in the construction of any shorthand system, so far as they could be ascertained by reading, conference or original research; with out regard to their bearing on any particular system past, present or future. Although necessarily neither complete nor final it may be considered substantially correct as far as it goes and sufficiently complete to be accepted as a guide.

Structure.— The propositions of the science are classified under seven heads: 0 General considerations; 1 Phonetic or sounds; 2 Geometric or signs; 2:1 Assignment of signs to sounds; 3 Manual of writing; 4 Visual or reading; 5 Mental or remembering.

Each main head is subdivided into three classes: (a) Axioms and definitions — which should involve no scientific controversy at the present time; (b) Canons — which are considered proven or demonstrable but recognized as still subject to controversy in greater or less degree; (c) Theorems — put forward rather for discussion and investigation than for immediate acceptance.

The direct work of the science has been supplemented by extensive researches giving the relative frequency of every sound and the commoner syllables and words of English, and is being further supplemented by various experimental data on the relative facility of the possi-

ble signs and sign combinations of shorthand writing and their relation to penmanship technique. Much more remains to be done, but the work is going forward under the direction of the leading state and national associations.

Limitations.—Students of shorthand science will be struck by the absence from the science of any specific pronouncement on such leading questions of shorthand as: Whether to shade or not to shade stems; Whether to write stems on two, three or four distinct slopes; Whether to use the appendages for primary representation of vowels or for secondary representation of consonants. This is because such questions are not single separate factors of any shorthand problem, but are each a complex of a dozen or more important and inter-related factors, so that to pass judgment on such decisions would easily become dogmatic and enormously restrict the scope and usefulness of the science.

Purpose.—The purpose of the science of shorthand is to provide those standards of measurement and their accompanying definition of terms essential to scientific shorthand progress; to be used analytically to determine the strength or weakness of existing systems, or synthetically to determine the construction of future shorthand systems.

Specific Propositions.—A few of the more important propositions of the science, illustrative of the plan and scope, are given below. The complete series is accessible in the Proceedings of the New York State Shorthand Reporters Association. The first figure of each number refers to the main head noted above, the letter to the subclass. The second figure is a serial number in each subclass, for purposes of convenient reference.

0 a 4. No system of shorthand can conceivably be *best* in every important point, for several of the most important basic features are mutually incompatible. "Every fair minded person who has paid any attention to the relative merits of different systems, or who has himself tried his hand at system-making, knows that the best result can only be attained by judicious compromise. One advantage cannot be obtained in its highest degree without the sacrifice of other advantages, and no sound judgment can be arrived at by setting up one particular point of superiority as the sole test of excellence." (Everett.)

0 b 8. "Time, not space, is the proper measure of brevity." (Guest.)

1 a 1. The total number of different sounds in spoken English can no more be determined than the total number of different colors in the spectrum, and for the same reason—that they blend into one another by imperceptible degrees or shades.

1 a 2. A minimum number of sounds necessary to be distinguished for phonetic writing of English may be and has been conclusively determined. This minimum number is 40, counting diphthongs. (See table of comparative alphabets under SHORTHAND.)

2 a 1. The simplest conceivable material for graphic purposes is composed of right lines and arcs of simple curves, whether of circular, elliptic or other assumed origin.

2 a 6. The principal material for modifying or supplementing the simplest straight and curved stems consists of circles, hooks and loops, small and large, initial and final, and, in the case of straight stems particularly, right and left.

2:1 a 2. Latham's second law: "2 That sounds within a determined degree of likeness be represented by signs within a determined degree of likeness; whilst sounds beyond a certain degree of likeness be represented by distinct and different signs, *and that uniformly.*"

2:1 b 1. (Assignment of signs to sounds in a simple shorthand for general use.) Must not suggest by geometric similarities phonetic relations contrary to fact.

3 a 2. The relative ease of the various strokes which are possible material for shorthand writing will be profoundly affected by the muscles chosen to perform the principal effort and control of writing, and by the position of holding the pen or pencil. It is therefore essential that instructions for pen position and muscles to be used be adapted to each other, and to the genius of the system to be written; or, conversely, that in the construction of a shorthand system these points be determined in advance of its analysis of other data.

3 a 4. Other things being equal, a shorthand which employs symbols of *only* one length, one thickness or one position, will be more *facile* than a system employing symbols of more than one length, thickness or position. In practice, observation of all three of these restrictions would make impossible the condition of "other things being equal."

4 a 2. Other things being equal, a shorthand which, within the limits of clear distinction, employs symbols of *more than* one length, one thickness or one position, will be more *legible* than a system employing symbols of only one length, thickness or position.

5 a 1. "Rules should be simple, comprehensive, logical, and as nearly as possible free from exceptions." (Guest.)

5 a 2. The less of a word or phrase is expressed or implied the more of it must be remembered.

5 a 6. Arbitrary abbreviations are always objectionable, but are least objectionable in words of most frequent occurrence; for the double reason that their economy is so much the more valuable, and their meaning so much the more readily remembered.

5 b 2. Words are most readily recognized by their first elements, next by their last elements and least by their middle elements.

GODFREY DEWEY,
New York State Shorthand Reporters' Association.

SHORTHORN. See CATTLE.

SHORTHOUSE, shôrt'hous, **Joseph Henry,** English manufacturer and author: b. Birmingham, England, Sept. 9, 1834; d. London, March 4, 1903. After a secondary education at Tottenham, he became a manufacturer of sulphuric acid at Birmingham, but soon found his calling in literature, and privately printed a half-mystical work of fiction, *John Inglesant.* This was published in 1881, was much talked of and gained a solid success. Other works of his, such as *The Little Schoolmaster Mark* (1883–1884) and *Sir Percival* (1886), did not encounter a similar acceptance, but are greatly prized by thoughtful readers. Besides his fiction he wrote an essay on *The Platonism of Wordsworth* (1882). See also JOHN INGLESANT.

SHORTIA, a genus of plants of the Diapensia family, containing two species, one (*S. uniflora*), in Japan, and the other a very local plant, in the Allegheny Mountains. The latter species (*Shortia glacifolia*), is an interesting plant, historically, being closely associated with Dr. Asa Gray. When in Paris in 1839, Dr. Gray saw an unnamed specimen, with only leaves and fruit, in the herbarium of André Michaux, who stated that he had collected it in 1788, in the high mountains of Carolina. Dr. Gray afterward searched for it in that region, but was unsuccessful. He, however, described this plant, "with the habit of pyrola and the foliage of galax," and named it in honor of Dr. C. W. Short. The *Shortia* was afterward found (1877), although not in the locality mentioned by Michaux, but was in flower and was sent to Dr. Gray to verify his classification. In 1886, almost 100 years after it was first seen, and after much laborious searching, the *Shortia* was rediscovered by Dr. Sargent, in practically the identical region visited by Michaux. It has a creeping rootstock, a large tuft of long-petioled, evergreen leaves, with brownish stains, thin and serrate and shaped very like the galax leaves used in floral decorations. There are several flower scapes, some six inches tall, bearing solitary nodding, five-parted, bell-shaped flowers an inch long and wide, with white-fringed petals, blooming in the early spring.

SHORTITE, a new mineral discovered in 1939 as disseminated well-formed crystals in sections of a core taken from the John Hay oil and gas well, drilled in Sweetwater County, Wyoming, at depths of 1,250 to 1,800 feet below the earth's surface. It was identified by J. J. Fahey, chemist in the United States Geological Survey laboratory, and was named for Dr. M. N. Short, a former geologist of the survey; later professor of optical mineralogy at the University of Arizona. Shortite is composed of a double carbonate of sodium and calcium, and it is believed that it may be adapted to use in glass-making and ceramics work, should it be found in sufficient quantities.

SHORTT, Adam, Canadian political economist: b. near London, Ontario, Canada, Nov. 24, 1859; d. Jan. 14, 1931. He was educated at Queens, Edinburgh, and Glasgow universities; was professor of political science, Queen's University, for a number of years, and became Dominion Civil Service commissioner in 1908; created C. M. G. in 1911. He devoted himself to a study of Canadian economic and political development, and published a number of volumes relating to Canadian currency, exchange and finance, trade, etc.; including *Imperial Preferential Trade from a Canadian Point of View; Report on Railway Taxation for the Ontario Government; Documents Relating to Constitutional History of Canada, 1759–1791* (2 vols.); *Life of Lord Sydenham* (in Makers of Canada Series).

SHOSHONE FALLS, a waterfall of the Snake River (q.v.), in the south of Idaho, about 30 miles south of Shoshone. Above the falls proper, the cañon is about 750 feet wide and 1,200 feet deep. The waters are deep and flow with scarcely a ripple until the rapids are reached, when the water spreads out fan-like and drops over numerous precipices, some 50 feet in height, then, as it were, gathers its entire volume and plunges over a precipice 210 feet in height. Below this fall the cañon is about 1,000 feet in depth. Four miles higher up are the Little Shoshone Falls, a broken cataract of 182 feet.

SHOSHONEAN INDIANS are those who speak languages belonging to the Shoshonean stock of the Uto-Aztecan linguistic family. Many separate sociopolitical groups, sometimes designated tribes or bands, have been combined into four branches and eight divisions of the linguistic stock. The Plateau branch included the Mono-Bannock, Shoshoni-Comanche, and Ute-Chemehuevi divisions. The Kern River branch had a single division, the Tübatulabal. The Southern California branch included Serrano, Gabrielino and Luiseño-Cahuilla divisions. The Pueblo branch, the most distinctive linguistically and culturally, was spoken only by the Hopi of northern Arizona. With the exception of the Pima and Papago tribes of southern Arizona, whose affiliations were with Mexican Indians, all speakers of Uto-Aztecan languages in the United States belong to the Shoshonean stock.

Although some Shoshonean speaking peoples are separated from the main block, like the Hopi and Comanche, geographically the Shoshoneans belong to the semi-desert, basin and range, sagebrush region of the Great Basin, or more exactly the area between the Rocky Mountains and the Sierre Nevada mountains. Even though they reached the Pacific coast in Southern California and extended into the plains in Wyoming, their prehistoric aboriginal habitat was primarily the arid country of Utah, Nevada, southeastern Oregon, southern Idaho, southwestern Wyoming, and Southern California. It was about 1700 when the Comanche, Shoshoneans of Wyoming, received horses from the Spanish and guns and ammunition from the French, so that they could become raiders of the plains. At the opposite extreme of Shoshonean area, in southern California, the aboriginal way of life of the Serrano, Gabrielino, Luiseño, and other Shoshoneans who had reached the Pacific, was disrupted by the establishment of Spanish missions during the last three decades of the 18th century. The missions were established as follows: San Gabriel in 1771, San Juan Capistrano in 1776, Los Angeles in 1781, San Fernando in 1797. Although established in territory of Shoshonean speaking Indians, the missionaries brought together Indians of diverse speech and tried to convert them quickly to Christianity; consequently, ancient ways of life were lost before they could be fully recorded.

The Great Basin is the oldest known homeland of Shoshonean speaking Indians, and it appears that their migrations into the plains on one side and into California on the other began in this arid area of salt lakes. Inasmuch as Indians in this unattractive region were able to continue their aboriginal practices until the last half of the 19th century, aged individuals were living in 1940 who had participated in completely native Shoshonean culture. From old Northern Paiute, Shoshoni, Ute, Gosiute, and Southern Paiute Indians were received accounts of pre-European customs, beliefs and practices. It is difficult to imagine a people surviving with a simpler culture.

Dependent upon the resources of a very poor environment, for the Great Basin Indians had a hunting and gathering culture without domesticated plants or animals, except the dog, the Shoshoneans survived only by using everything

available. They ate insects, reptiles, and rodents, as well as the larger mammals, buffalo, deer, antelope, and mountain sheep, found in the mountains and more fertile valleys. Streams flowing from the mountains and disappearing into sandy basins, swamps, brackish and salt lakes furnished fish and water fowl. Wild roots, seeds, berries, and, especially, pinyon pinenuts, served as vegetable food. Shoshonean housing, always simple, varied with the products available from a tule and bulrush covered domed hut to a brush covered lean-to. Skin tepees appear to have been unknown in the Great Basin until after the arrival of the horse, for some places as late as 1860.

Political and social organization also varied with the environment. In more favored valleys a larger population allowed for a formal chieftain and rules of marriage and residence. Most of the Shoshoneans seem to have lived in individual family groups with an elder having only informal control. Except for avoiding incest between parents and children and between brother and sister, marriage depended upon circumstances. Polygamy, polyandry and monogamy were known. Wives were obtained by murder, stealing, war, exchange, purchase, loan, and courtship. The religion of the Shoshoneans was animistic and shamanistic. Shamans, who obtained power from personal spirits, could be good or bad, or even alternately curing shamans and witches. Mythology was the one aspect of culture which was rich, with many stories centering around Coyote and Wolf, powerful supernatural beings. Although Coyote was the highest of the gods, he was often depicted as a lecherous trickster.

Like the Comanche, many of the other Shoshoneans changed rapidly after receiving horses. The Ute of Colorado, for example, became nomadic hunters, traveling from their mountain homes to the plains to hunt buffalo. The material culture of the Colorado Ute came to resemble plains culture. A similar development occurred among the Windriver Shoshoni. The small Nevada Indian population was overwhelmed by miners and ranchers between 1870 and 1890, which partly explains the origin of two messianic cults. The two religious movements, called Ghost Dances, were started by Northern Paiute (sometimes called Paviotso) near Walker Lake, Nevada. Wodziwob was the prophet of the 1870 version which spread to California and his son, Wovoka (Jack Wilson), was prophet in 1890 and started the Ghost Dance which was enthusiastically accepted by the Plains Indians.

Kroeber (1939) estimates 50,300 was the total Shoshonean population in pre-Columbian times; subdivided as follows: Comanche, 7,000; Southern California, 20,000; Inter-mountain region, 20,500; Hopi, 2,800.

In 1950 the best population estimates for some and actual census for other groups give the following: Total Shoshonean, 24,015; Comanche, 2,694; Southern California, 2,700; Intermountain region, 13,787; Hopi, 4,834. Population records of some of the separate groups: UTE: 1870—4,000; 1885—3,391; 1909—2,014; 1930—1,980; 1950—2,455. NORTHERN PAIUTE (sometimes designated Paviotso, or Mono-Paviotso) including Bannock: 1870—8,000; 1910—3,451; 1950—3,895. SOUTHERN PAIUTE: 1870—2,527; 1910—1,079; 1950—938. GOSIUTE: 1870—256; 1920—152; 1950—229. COMANCHE: 1780—25,000; 1816—9,000; 1872—4,000; 1910—1,513; 1930—1,923; 1950—2,694.

L., *Cultural and Natural Areas of Native North America* (Berkeley 1939); also monographic studies published by the University of California by J. H. Steward, O. C. Stewart, Isabel T. Kelly, D. Shimkin, R. H. Lowie, A. L. Kroeber, C. F. and E. W. Voegelin, and others. Other important writers on various Shoshonean peoples (except Hopi) are E. Adamson Hoebel, A. B. Thomas, Anne Cook Smith, Marvin K. Opler, Willard Z. Park, C. F. and E. W. Voegelin, Edward Sapir; Jack Harris, Ralph Linton, Carling Malouf, J. W. Powell, and Father Escalante (1776).

OMAR C. STEWART.

SHOSTAKOVICH, shŭ-stŭ-kô'vyĭch, **Dimitri,** Russian composer: b. St. Petersburg (Leningrad), 1906. While a student at the Leningrad Conservatory (1919–1925) he wrote his first symphony, the success of which encouraged him to undertake further symphonic compositions. His fifth (1937) commemorated the 20th anniversary of the October Revolution, while the seventh (1942) panegyrized the defense of Leningrad against German assaults. Other works include the operas, *The Nose* (Leningrad, 1930) and *Lady Macbeth of Minsk* (Leningrad, 1934; New York, 1935). He also composed several ballets, piano pieces, and music for Russian films. In March 1952 he received a 2d class Stalin prize for ten songs.

SHOTGUN, a small-arm with smooth bore, used for firing a charge of small shot in hunting wild fowl and small animals. It may have one barrel or two, and is called accordingly single-barreled or double-barreled. Two other types are recognized: the muzzle-loader and the breech-loader. The former type is no longer manufactured, but many such firearms of the olden time are still in existence, and hold their own in accuracy and effectiveness with the most carefully made modern weapons of this class.

The forerunner of the shotgun was the old-time blunderbuss, with its spreading wide-mouthed barrel devised to scatter its handful of miscellaneous missiles over as large an area as possible, with still enough striking force in them to accomplish its purpose. It had a range of about 100 feet. The shotgun of today has but little longer range (40 yards) but delivers its charge in a more condensed group and with the expenditure of considerably less powder.

The principal parts of a shotgun are the barrel, the frame and the stock. The necessity of having a barrel sufficiently strong to withstand the force of the powder explosion and at the same time provide a weapon not too great in weight to be comfortably carried about for a day's sport led to an ingenious plan by which the force released might be controlled by the greater lengthwise resistance of the fibres in a rolled bar. Wrought iron and steel strips were laid alternately and twisted together, and then wound in a close spiral around a rod-like mandrel. This spiral was then heated and welded into a solid tube, which was afterward bored out as to the inside and turned, "browned" with acid and polished on the outside, then presenting the peculiar grain which marked the "twist" or "Damascus" barrels so familiar a generation ago. The success of these light tubes in withstanding the sudden bursting pressure to which they were subjected developed another difficulty; the gun was too light to take up a sufficient part of the recoil to render its use agreeable. This fault was very quickly and happily remedied by adding another barrel, which not only

brought the weapon to an adequate mass, but afforded the huntsman the opportunity of a second shot.

Following the invention of breech-loading mechanism for rifles, this improvement was adapted to the shotgun by the device of «breaking» the barrels on a hinge-joint at the frame, so that the open butt of the barrel was presented for the insertion of the cartridge. The leaking of the gases of explosion, however, called for further improvement, and this was secured by the invention of an expanding shell for the cartridge. The force of the exploding powder automatically expands this shell so snugly into the breech chamber that all leakage of gas is prevented.

The next advance, the hammerless gun, was also the result of an improvement of the cartridge so that a centre pin could be used to explode the charge. The rim-fire cartridge thereupon disappeared and with it the projecting hammers.

Another important improvement of the shotgun had progressed contemporaneously with those already noticed; the introduction of the choke bore. While choke-boring had been invented as early as 1781, it was not definitely adopted until 1866. It consisted in contracting the gun-barrel slightly near the muzzle for the last few inches of its length — in some cases for five to eight inches, in other makes for two or three inches. Some gun manufacturers taper the choke to a conical form; others introduce a shoulder with gently rounding curves a few inches from the mouth; and there are several modifications of these practices. In the straight-barreled or non-choking gun only 30 per cent of the shot in the charge reach a target 30 inches in diameter at a distance of 40 yards. With the choke-bore barrel (other things being equal) 70 per cent of the shot is delivered upon the 30-inch circle. The explanations of this result have been many, but the one generally accepted is that the choke momentarily holds back the wad, and with it the forcibly expanding gases which otherwise have a tendency to scatter the shot laterally just as they leave the muzzle. Gun barrels are made «full-choke» or «modified choke.» In a 12-gauge gun the bore is 0.730 inch; with full-choke the mouth is narrowed to a diameter of 0.695 inch; with modified choke, to 0.716 inch.

The modern gun is of 10, 12 or 16 gauge, double-barreled, breech-loading and hammerless. It may have two triggers, one for each barrel, or but one trigger, a second pull on which fires the second barrel. The pull on the trigger is gauged from three to six pounds, less than three pounds being considered dangerous. The great majority of the American guns of the present day have barrels of forged steel. The bar from which a barrel is to be made is first rough-bored, then rough-turned on the outside and then straightened by hammering. It is then turned again and ground on a broad-faced stone. The lug is then brazed on. The inside of the barrel is then reamed out several times up to the choke, and this is shaped by special reamers according to the pattern desired. The two barrels selected to be associated in the double-barreled gun are tinned along their adjacent sides and blocks of metal are placed between them to keep them at the proper distance apart, the centre lines of the muzzles converging three-sixteenths inch for 30-inch barrels. The ribs are then soldered into the rabbets prepared for them. The stock of the gun is of walnut, Circassian walnut being favored for fine guns. The frame is of steel and serves to connect the barrels to the stock as well as to house the lock mechanism. The gun may also be a repeater, firing several shots in quick succession from a magazine lying under the barrels. A well-made gun of 12-gauge will weigh from five and one-half to seven pounds, depending upon the work expected from it.

Military Shotgun.— The military shotgun used by the American army in the Great War for night expeditions in «No Man's Land» and in clearing up trenches had a barrel 20 inches in length and carried a bayonet. It was of the repeating type, firing six times before reloading. The charge was of nine buckshot, and its shooting qualities are exceptional. Upon a life-sized manikin, at 30 yards all nine of the shot hit the target; at 50 yards the hits ranged from four to eight; at 80 yards, two to four hits; at 100 yards, always one hit and often two.

SHOTWELL, James Thomson, American historian: b. Strathroy, Ontario, Canada, 6 Aug. 1874. He was graduated at Toronto University in 1898 and took his Ph.D. at Columbia University in 1903. He has been connected with the faculty at Columbia since 1900 and since 1908 has been professor of history there. He was assistant general editor of the 'Encyclopedia Britannica' in London in 1904–05. He also edited 'Records of Civilization' (20 vols.). Author of 'Sources and Studies' (3 vols., 1915–16). He was a member of the American mission which accompanied President Wilson to the Peace Conference in Paris in 1919.

SHOULDER-GIRDLE. See SHOULDER-JOINT.

SHOULDER-JOINT, the articulation of the upper arm or humerus with the glenoid cavity of the scapula or shoulder-blade. This joint is an example of the enarthrodial or ball-and-socket joints; the ball-like or rounded head of the humerus working in the shallow cup of the glenoid cavity. The head of the humerus is very large when compared with the glenoid or receiving cavity. The capsule which surrounds and encloses the joint is of very loose nature, but is intimately connected with the muscles which are attached to the head of the humerus. The joint itself is guarded against dislocation or displacement by the strong ligaments surrounding it, as well as by the tendons of its investing and other muscles; while superiorly the acromion and coracoid processes of the scapula form an arch, together with the coraco-acromial ligament, which further serves to protect the joint. The shoulder arch or girdle, also called pectoral arch or girdle, is in vertebrates

—in mammals, none above monotremes (see MONOTREMATA)—usually attached to the sternum ventrally, and to it the forelimbs are articulated. It has only an indirect connection with the vertebral column. Rudimentary or greatly modified in the majority of mammals, this girdle is especially marked in certain groups of birds. In man the clavicle is completely developed, and with the scapula this forms the bone structure of the shoulder girdle, which, relatively, is endowed with superior strength.

The articulating surfaces of the shoulder joint are covered with cartilage. The capsular ligament forms the chief ligamentous structure. It serves chiefly to support the inner and upper portion of the glenoid ligament, which is fixed around the margin of the cavity of that name. Its function is chiefly that of deepening the cavity by adding to its circumference, and it also protects the bony edge of the cavity. The motions of the shoulder joint are limited and controlled by the interlocking of the bones, as well as by the tension of the capsule. The biceps muscle, in the relations of its tendons to this joint, subserves several important uses. Primarily, and from its connection with both elbow and shoulder joints, it brings the movements of both into harmonious relation; while it strengthens the upper portion of the articular cavity and steadies the head of the humerus, through its relation to the bicipital groove of that bone.

This joint is liable to various diseases and injuries. Local injury may result in inflammation, while diseased conditions of constitutional origin may give rise to strumous or scrofulous disorders of the joint, to syphilitic lesions and gouty or rheumatic attacks. Of the accidents to which the joint is liable, dislocations are by far the most frequent, while fractures are not uncommon. Fracture of the acromion process of the scapula, of the coracoid process, of the neck of the shoulder blade and of the upper part of the humerus are of most common occurrence among these accidents.

SHOVELLER, or SPOONBILL, a freshwater duck (*Spatula clypeata*), distinguished by the bill being longer than the head and narrowed at its base, while the tip is hooked and broadened and its fringelike processes are long and slender. The average length of this bird is about 18 or 20 inches. The male has the head and upper neck bright green, and the lower neck white. The scapular feathers are white. The back is brown, the primary wing-feathers blackish-brown. The tip of the wing is pale blue, as also are the wing-coverts. The tail and upper tail coverts are black. The breast and belly are light brown or chestnut. It feeds on worms, insects, snails, small fishes and vegetable matters and inhabits lake-margins and marshy spots and breeds numerously all over the northern half of North America as well as in northern Europe and Asia, making its nest on the ground.

SHRADY, shrā'dĭ, **George Frederick,** American surgeon and editor: b. New York, Jan. 14, 1837; d. Nov. 30, 1907. He was consulting surgeon to the Saint Francis, the Columbus, the General Memorial and the Health Department hospitals in New York, and was consulting surgeon in attendance upon General Grant in his last illness. He edited the *American Medical Times* in 1860–1864, and in 1866 founded the *Medical Record,* of which he served as editor until his death.

SHRADY, Henry Merwin, American sculptor: b. New York City, Oct. 24, 1871; d. there, April 12, 1922. Graduating from Columbia (1894), he studied law, went into business and, finally taking up sculpture as an amateur, developed himself, without the direction of any teacher, into a professional sculptor. He was successful in a competition for the execution of an equestrian statue in Brooklyn ($50,000) in 1901; of the *Grant Memorial* for Washington ($250,000) in 1902. Subsequently he was commissioned by the Holland Society of New York to make an equestrian statue of *William the Silent.* His later works include equestrian statues of *General Williams* (Detroit); *General Lee* (Chancellorsville, Va.); *General Grant* (Washington), dedicated 1922.

SHRAPNEL. See PROJECTILES.

SHREVE, shrēv, **Henry Miller,** American inventor: b. Burlington County, N. J., Oct. 21, 1785; d. St. Louis, Mo., March 6, 1854. Early in life he engaged in navigation on the Western rivers, and in 1815 ascended the Mississippi and Ohio to Louisville, Ky., in the *Enterprise,* the first river steamboat. In 1820 he built the *Washington* of 400 tons burden; remodeled it in 1824, so as to operate each of the side wheels with a separate engine; invented the snag boat *Heliopolis* for removing snags from rivers, and in 1829 patented a steam battering ram for harbor defense. In 1826 he was made superintendent of improvements in Western rivers and continued in that office till 1841.

SHREVEPORT, city, Louisiana, seat of Caddo Parish, 18 miles east of Texas border on the Red River and on the Kansas City Southern, the Louisiana and Arkansas, the Texas and Pacific, the Illinois Central, the St. Louis and Southwestern, and the Southern Pacific railroads. The city has two airports, Barksdale Air Force Base, military, and a commercial port with airline service. Situated at an altitude of 179 feet in the northwest corner of the state, near the oil and gas fields of eastern Texas and southern Arkansas, and immediately surrounded by similar fields in Louisiana, Shreveport ranks high as an oil refining center and a distributing point. It has lumber mills, iron and steel foundries, railroad shops, cottonseed-oil mills, and plants producing sheet window glass, fertilizer, sheet metal products, and a wide variety of commercial goods.

Educational facilities include St. Vincent's College, with state-recognized teacher training courses; and Centenary College of Louisiana. The Shreve Memorial Library, like the city itself, is named for Capt. Henry M. Shreve. Barksdale Air Force Base is an air corps training station. Flood-control projects include an improved Red River channel, giving the city barge-line service over the inland waterway system. The city was founded about 1834, and was incorporated in 1839. The government is administered by mayor and council Pop. (1950) 127,206.

SHREW, one of the minute mammals of the family Soricidae and order Insectivora, particularly the common (*Sorex vulgaris*) and the

Lesser Shrew (*S. pygmæus*). The former are about the size of a mouse, which it somewhat resembles in the shape of the body, feet and tail, but has the muzzle produced far beyond the lip. The shrews have hairy mouse-like bodies and ordinary feet formed for running, and not for burrowing, as in the allied moles; the eyes and ears are comparatively well developed. They live on the ground, though a few are arboreal and others aquatic. The jaws are prolonged and a mobile snout generally exists. There are six upper and four lower incisors, the middle pair of the upper jaw being long and curved. The first lower incisors project horizontally and form with the upper ones a forceps-like structure for the grasping of small insects, which form the larger part of their fare. This family is much the largest one of the Insectivora and the numerous species are found in most parts of the world and present many interesting adaptations.

Within the limits of the United States four genera and about 60 species occur. In the typical genus *Sorex* the ears are large and of normal conformation and the feet are not fringed with stiff hairs. The common shrew is a frail little creature less than three inches long with a scantily-haired tail measuring one inch and may readily be distinguished by its prolonged muzzle and by the teeth being colored brown at their tips. It feeds upon insects and their larvæ and inhabits dry places, making a nest of leaves and grasses. The young, numbering from five to seven, are born in the spring. These little animals are very voracious in their habits and frequently kill and devour one another. *Neosorex* has large feet fringed with stiff hairs and includes the large water shrew, six inches long, as well as several other species. It lives in burrows leading to the water, which it enters in search of snails, etc., upon which it largely feeds. This species is found chiefly in the Rocky Mountain region and central plateau.

Blarina is a characteristically American genus with mole-like fur and the external ear well developed but turned forward in such a manner as to cover the opening and conceal itself among the hair. The short-tailed or mole shrew (*B. brevicauda*) is the best-known species of shrew in the eastern United States. It is about four and one-half inches long with a hairy tail measuring one inch. In general habits it resembles *Sorex*. During the winter it remains quite active and is frequently found on the surface of or burrowing in the snow. At this season it feeds largely on beechnuts as well as hibernating chrysalids and larvæ. It is a bloodthirsty creature and when confined attacks and devours its own kind as well as mice larger than itself. Like other shrews it has upon the knees and elbows glands, the secretion of which give it a peculiar and disagreeable odor.

Among interesting exotic species the following may be mentioned: the European and Asiatic water shrew (*Crossapus fodiens*) attains a total length of from four and one-half to five inches. The fur is of delicate texture and adapted to resist the action of water. A prominent fringe of stiff white hairs is found on the tail as well as the toes of this form, this fringe forming a distinctive feature of the species. The teeth are also fewer than in the American water shrew. The food resembles that of the common shrew, but aquatic larvæ and the young of fishes appear to form a large part of its nutriment. They are of very active habits, diving and swimming with great facility. The musk-shrew (*Crocidura cærulea*) of India is remarkable for the strong musky odor which emanates from glands situated on the sides of the body. It enters houses at night to feed upon cockroaches. Resembling the *Soricidæ* are the elephant-shrews (*Macroscelidæ*). They have the zygoma and auditory bulla developed and the muzzle forms a slender, proboscis-like organ with the nostrils at its tip. The eyes are of moderate size and the ears well developed and covered with hairs. The fore feet are short and possess five toes, while the hind legs and feet are very long and are provided with compressed claw-like nails. The tail is elongated and slender. The elephant shrews or jumping shrews are confined to Africa. The favorite attitude of these creatures is a sitting posture, much resembling that of the jerboas and kangaroos, and from the greater length of the hind as compared with the fore limbs they also, like these animals, progress by leaping. They inhabit dry rocky situations, feed on insects and other small Invertebrata and are nocturnal. Consult Dobson, 'Proceedings Zoological Society' of London (1890); Dobson, 'Monograph of the Insectivora' (London 1882–90); Merriam, 'Mammals of the Adirondack Region' (New York 1884); and Merriam and Miller, 'North American Fauna No. 10' (Washington 1895).

SHREW-MOLE, a large mole (*Scalops aquaticus*) inhabiting wet meadows and the borders of marshes and streams throughout most of North America. See MOLE.

SHREWSBURY, shrōz'bŭ-rĭ, England, the county-seat of Shropshire, on the left bank of the Severn, 42 miles northwest of Birmingham and 163 miles northwest of London. The town is unusually picturesque. The bridges are interesting features, four of them spanning the river, which here takes a winding course around the hills. The streets are narrow and steep and bordered by old frame houses. An archway of the period of James II and two towers of the reign of Edward I are parts of the old castle built by Roger de Montgomery. Saint Mary's, an interesting church of the 10th century; Saint Giles'— dates from the reign of Henry I; — Holy Cross, early Norman, and Saint Alkmonds are the most noteworthy churches. The other public buildings are public halls, museum, free library, market-house — including corn exchange — barracks and Royal Grammar School. The industries include foundries, tanning and brewing. Shrewsbury School, founded 1552, is one of the great public schools. Pop. (1942 est.) 44,860.

SHRIKE, or **BUTCHER-BIRD**, a bird of the passerine family *Laniidæ*, and especially of the typical group *Laniinæ;* several other subfamilies are not represented in North America. The true shrikes have the bill broad at the base, and hooked and toothed at the tip, resembling the bill of a bird of prey. A dense tuft of bristles surrounds the nostrils and others project from the base of the bill. The feet are small, and, except for the laterally scutellate structure, are of typically passerine type. The shrikes feed chiefly upon insects, reptiles, small

mammals and small birds and their young. About 200 species of shrikes are found in all parts of the world, and four species of *Lanius* within the United States. Other individual names are the Great Gray Shrike (*L. excubitor*), the Lesser Gray Shrike (*L. minor*) and the Red-backed Shrike (*L. collurio*), the latter, like *L. septentrionalis*, being often called the Nine-killer Shrike. The loggerhead shrike (*L. ludovicianus*) is the usual summer species of the eastern United States, where it is resident southerly and migratory in the North. These birds are seen usually in pairs flitting about the borders of woods and along fence-rows. The food consists chiefly of insects which the male is said sometimes to impale on thorns. They also attack the young of other birds. The nest is generally built in bushes and is of large size and composed of grass and weeds lined with hair and feathers. The eggs, usually five in number, are white, tinted with green and spotted with brown of various hues. The loggerhead shrike is eight or nine inches long, slate-colored above and plain ashy white below, with a black stripe through the eyes and meeting across the forehead. In the West it is replaced by two sub-species, the white-rumped and the California shrikes.

The Great Northern shrike (*L. borealis*) is found in the United States only in winter and breeds in British America. It is 9 to 10 inches long, marked below with numerous fine, wavy, dusky lines and the eye stripe is interrupted on the forehead. The nest is built in trees and the four to six eggs are similar to those of the loggerhead shrike. The song is harsh, but this bird possesses considerable imitative powers. The food consists of mice, shrews, insects and in winter especially of small birds. This species especially has a habit of suspending its prey upon thorns or fence splinters, or in forks of tree-branches. The significance of this remarkable habit is not understood. By some it is believed to be a storage of food; by others only an effort at convenience in eating the prey.

Closely related species of shrikes with similar habits occur in Europe and more distinct ones in other countries. The *Oreœca cristata* of Australia lives chiefly on the ground and is noted for its peculiar and somewhat ventriloquial song, which begins with low notes and gradually increases in height and power so as to delude the hearer into fancying that the songster has been gradually coming from a great distance toward him. It is sometimes called the bell-bird. The piping-crow (q.v.) and the pied crow-shrike (*Strepera graculina*), of New South Wales, represent a distinct sub-family. Various other birds have been named "shrikes," of which the most important are the bush-shrikes which belong with the ant-birds in the family *Formicaridæ*. Consult Gadow, 'Catalogue of the Birds of British Museum,' Vol. XV (London 1890); Evans, 'Birds' (London 1900); Newton, A., 'Dictionary of Birds' (New York 1896).

SHRIMP, a small decapod crustacean (see DECAPODA; CRUSTACEA) of the genus *Crangon*, allied to the lobster, crayfish and prawn. They inhabit sandy coasts and in Europe are caught for market in immense numbers by nets when swimming about near the beach at high tide. The familiar species, *C. vulgaris*, about two inches long, greenish-gray dotted with brown, is esteemed as an article of food. A related species (*C. franciscorum*) is found on the California coast where it has considerable commercial importance, being gathered and dried by the Chinese. The red color exhibited by shrimps when prepared for the table is the result of a chemical change during cooking, they being naturally translucent and colored much like the sand in which they live. A very great number of crustaceans more or less closely related to the shrimps live in the sea and a few in fresh water. Consult Stebbing, 'Crustacea' (New York 1903).

SHRINE, the case in which holy relics are kept. Shrines are usually richly ornamented with gold, precious stones and elaborate carvings. The earliest form of shrines was that of the diminutive model of a Gothic church with high-pitched roof. Some shrines, as that of Saint Alban, Britain's protomartyr at Saint Albans, that of Saint Edward the Confessor at Westminster, of Saint Genevieve at Paris, were imposing architectural structures. The shrine of Saint Charles Borromeo in the Duomo of Milan is of beaten silver faced with rock-crystal.

SHROPSHIRE, a breed of sheep (q.v.).

SHROUD, a word derived from the Anglo-Saxon «scrud,» a garment, and meaning more especially the winding-sheet in which it was customary to wrap the dead. This custom has been generally abandoned and the dead are buried in ordinary clothing, retaining to the last as far as possible the aspect they presented in life. The shroud has figured in many ghost stories.

SHROUDS, large ropes stretched from the heads of the lower masts to both sides of a ship, where they are fastened to the dead-eyes, which are secured to the channels, to support the masts, and named according to the masts to which they belong, the main, fore and mizzen shrouds.

SHROVETIDE, the three days between the evening of the Saturday before Quinquagesima Sunday and the morning of Ash Wednesday; so called because anciently people were wont on those days to make confession of their sins and to obtain absolution (to be *shriven*) in preparation for the season of Lent. The Tuesday of Shrovetide is called Shrove Tuesday; its evening was given up to merrymaking and to feasting on pancakes and fritters: hence the name Pancake-Tuesday or Pancake-night: in French Shrove-Tuesday is Mardi-Gras (q.v.).

SHRUBS are woody-stemmed plants of low stature. They often have several slender main stems and branch close to the ground, retaining these lateral shoots, which are lignified, and bear fruit repeatedly. The lines of difference between herbs and shrubs, and shrubs and trees, are arbitrary and difficult to define exactly. Undershrubs are those perennials which send up from underground stems annual shoots that do not become woody and die off in the autumn as do those of *Salvia pratensis*. A semi-shrub is practically the shrubby herb, whose yearly shoots become woody only at the base before the next period of vegetation and wither and die off above this. The small shrub is a low or even trailing plant like *Deutzia*

gracilis and *Epigaea repens.* When larger and much branched, the shrub is called a bush; and when so large as to resemble a tree, as the syringa often is, it becomes arborescent. Some of the shrubs are even climbing plants, like *Celastrus scandens,* the bittersweet, and certain roses. Like trees, shrubs may be deciduous or evergreen, and are often thorny. They are apt to grow in almost impenetrable thickets, with interwoven branches, and form fringes of vegetation on forest edges, in swamps, fields and moors. They are extremely useful to the horticulturist for their flowers and for their fruits, often of economic value; and to the landscape gardener, for concealing fences and buildings, and for softening the edges of tree masses.

SHUBRICK, shōō'brĭk, **John Templer,** American naval officer, brother of William Branford Shubrick (q.v.): b. Bull's Island, S.C., Sept. 12, 1788; lost at sea in the sloop-of-war *Epervier,* July 1815. He entered the navy as midshipman in 1806, served on the *Chesapeake* in her encounter with the *Leopard* in 1807, and in 1812 was promoted lieutenant. He was assigned to the *Constitution,* participated in her engagement with the *Guerrière* in 1812, and was on the *Hornet* during her engagement with the *Peacock* in 1813, receiving medals from Congress for his services. He was second lieutenant of the *President* when she was captured in 1815; and in the war with Algiers in that year, he was lieutenant of the *Guerrière,* the flagship of Commodore Stephen Decatur (q.v.), with whom he was engaged in all the operations against the Barbary powers. Upon the conclusion of peace he was commissioned to bear the treaty to the United States. He sailed in command of the *Epervier* early in July 1815, and was never again heard from after passing Gibraltar.

SHUBRICK, William Branford, American naval officer, brother of John Templer Shubrick (q.v.); b. Bull's Island, S.C., Oct. 31, 1790; d. Washington, D.C., May 27, 1874. He entered Harvard in 1805, but was appointed midshipman in 1806. He attained rank as lieutenant in 1813, was placed in command of a gunboat in Hampton Roads, was engaged in the defense of Norfolk and the navy yard at Gosport, and later in that year was transferred to the *Constitution.* He participated in the capture of the *Cyane* and the *Levant* by that vessel and was voted a sword by his native state and a medal by Congress in recognition of his services. He sailed around the world in the *Washington* in 1815–18, the first United States vessel to make that cruise, was appointed commander in 1820; and served until 1826 in command of the navy yards at Charlestown, Mass., and at New York. In 1826 he was appointed to the command of the *Lexington,* was commissioned captain in 1831, and in 1838–40 was in command of the West India squadron. He had charge of the Norfolk navy yard in 1840–43, was chief of the bureau of clothing and provisions for the navy in 1845–46; appointed in the latter year to command the Pacific squadron, he captured several ports during the Mexican War; in 1852 he was appointed to the Lighthouse Board. He was in command of the Atlantic Coast squadron for a time in 1853, and then resumed his duties as chairman of the Lighthouse Board; he remained in that post until his retirement, with the exception of 1858–59, when he was in command of the Brazil squadron and Paraguay expedition. He was retired in 1861, but remained on the Advisory Board until 1870; in 1862 he was commissioned rear admiral. Consult Maclay, Edgar S., *History of the United States Navy from 1775 to 1893* (New York 1894).

SHUFELDT, shōō'fĕlt, **Robert Wilson,** American surgeon and ornithologist: b. New York, Dec. 1, 1850; d. 1934. He studied at Cornell University, school of engineering, but withdrew in 1873 to study medicine at Columbian (now George Washington) University, where he was graduated in 1876, receiving the prize for the best thesis, *6000 observations on temperature of children.* He had seen service early in the Civil War; became surgeon with Generals Merritt, Crook and Sheridan in frontier Indian wars 1876–81. He was appointed curator Army Medical Museum, Washington, 1882; honorary curator Smithsonian Institution 1895; judge at the World's Fair, Chicago, 1893; honorary member Royal Australasian Ornithological Union and in 1914 elected by that society to be delegate British Association for the Advancement of Science, Melbourne. He was author of nearly 1,300 titles (10,000 illustrations) to books, memoirs, papers, and articles, devoted to ornithology, anatomy, and physiology of the vertebrata; osteology of birds, mammals and fishes; nature study, art, travel, photography, taxidermy, medico-legal studies, medicine and surgery, reptiles, fossil animals, zoological gardens and their management, psychology, sociology and popular botany. His books included: *The Osteology of Amia calva* (1885); *The Myology of the Raven* (1890); *Osteology of Owls* (1900); *Osteology of Herodiones* (1901); *Osteology of Pigeons* (1901); *Studies of the Human Form* (1907); *Osteology of Birds* (1909); *Review of the Fossil Fauna of the Desert Region of Oregon* (1913); *Further Studies of Fossil Birds, with Descriptions of New and Extinct Species* (1913).

SHUFU, shōō'fü, China, a city of Sinkiang, formerly known as KASHGAR. It is situated on the Kizil Darya River, 100 miles northwest of Soche (Yarkand), its position at the junction of several great caravan routes making it the emporium of much of the commerce of central Asia. Both the old and the new town, the latter built in 1838, are surrounded by mud walls and moats; the new town contains the palace of the former Chinese governor. Cereals, fruits, and vegetables are grown in the surrounding fertile district, much of it by means of irrigation. Carpets, and cotton, gold, and silver cloths are manufactured. It was the capital of an independent kingdom until conquered by the Chinese during the 18th century. In 1865 it revolted, but was again subdued in 1876–77. Pop. 80,000.

SHULL, George Harrison, American botanist: b. Clark County, Ohio, April 15, 1874. He was graduated at Antioch College in 1901 and took his Ph.D. at the University of Chicago in 1904. He was botanical expert at the United States Bureau of Plant Industry in 1902–04; assistant in plant physiology at the University of Chicago in 1903–04; botanical investigator at the stations for experimental investigation at Carnegie Institute, Washington, and at Cold

Spring Harbor from 1904 until 1915. He was professor of botany and genetics at Princeton University until 1942, when he became professor emeritus. He founded the magazine *Genetics.*

SHUMAGIN, shōō'mà-gēn **ISLANDS,** a group of islands located off the south coast of Alaska Peninsula, latitude 53° N. and longitude 160° W. The Danish explorer Vitus Bering (q.v.) and an expedition group landed here between two small islands on Aug. 30, 1741, finding Aleut tribes already inhabiting them. Ten men of the crew, ill with scurvy, were taken ashore. One of them, Nikita Shumagin, died almost immediately, and the crew named the island for him. Later the name was applied to the whole group of islands.

SHURTLEFF, Roswell Morse, American artist: b. Rindge, N. H., June 14, 1838; d. Jan. 6, 1915. He was graduated at Dartmouth College in 1851, and worked at lithography and drawing on wood till 1861, when he enlisted with the 99th New York Volunteers, of which he became lieutenant and adjutant. He was the first Union officer wounded and taken prisoner in the Civil War, July 19, 1861, and was not released until after nearly eight months' imprisonment. Illustration of books and magazines absorbed his efforts for many years; however, in 1870 he began to paint, executing numerous landscapes in both water and oil, largely transcripts of scenery in the Adirondacks. The Corcoran Gallery, Washington, D.C., acquired his painting *The First Snow;* and the Metropolitan Museum, New York, *A Mountain Stream.*

SHUSTER, George Nauman, American author and educator: b. Lancaster, Wis., Aug. 27, 1894. He graduated with an A.B. degree from the University of Notre Dame in 1915, and during United States participation in World War I he served at the front with the army's intelligence section. In 1920, after further study at the University of Poitiers, France, he returned to Notre Dame as head of the English department. While there he took his master's degree in French literature and in 1922, published *The Catholic Spirit in Modern English Literature.* In 1925, he became associate editor of the *Commonweal,* a newly founded weekly dedicated to religious principles. He served as managing editor of that periodical from 1929 till 1937, and meanwhile continued to write books, those at this period including: *The Catholic Spirit in America* (1927); *The Catholic Church and Current Literature* (1929); *The Germans* (1932); *Strong Man Rules* (1934); and *Like a Mighty Army* (1935). In 1932 he visited Germany as an Oberlaender Trust fellow and returned there during 1937–1939 with a two-year Carnegie Corporation fellowship. He wrote the notes for a translation of Adolf Hitler's *Mein Kampf* (1939) and, turning to fiction, published *Look Away* (1939). In 1940 he was appointed president of Hunter College, New York City. After World War II, he was one of a group of educators who visited Germany to report upon its educational needs.

SHUSTER, William Morgan, American lawyer and financial expert: b. Washington, D. C., Feb. 23, 1877. He was educated at the Columbian (later the George Washington) University, and in 1899–1906 was in the United States Customs Service in Cuba and in the Philippines. During 1906–1909 he was a member of the Philippine Commission and secretary of public instruction in the Philippine Islands. From May 1911 until January 1912 he was treasurer-general and financial adviser to Iran. He became involved in difficulties through his determined opposition to Russian intrigue in Iran, and was forced to resign, the circumstances at the time attracting worldwide attention. From 1915 until 1933 he was president of The Century Company, publishers located in New York City; and from 1933, president of The D. Appleton-Century Company.

SHUTE, Henry Augustus, American author: b. Exeter, N. H., Nov. 17, 1856; d. there, Jan. 25, 1943. He was graduated from Harvard University in 1879 and was admitted to the bar in 1882; from 1883 he was police justice at Exeter. He was known for his humorous books, chiefly delineating boy characters, but written for adults. His books included: *The Real Diary of a Real Boy* (1902); *Letters to Beany and Love Letters of Plupy Shute* (1905); *Real Boys* (1905); *A Profane and Somewhat Unreliable History of Exeter* (1907); *A Country Lawyer* (1911); *Plupy "the Real Boy"* (1911); *The Misadventures of Three Good Boys* (1914); *The Youth of Plupy* (1917); *Brite and Fair* (1918); *Plupy, the Wirst Yet* (1929).

SHUTE, Nevil, professional name used by Nevil Shute Norway, English aeronautical engineer and author: b. Jan. 17, 1899. At the outbreak of World War I he was an undergraduate at Balliol College, Oxford University. He saw active service in France, and after hostilities ceased he completed his studies at Oxford. In 1924 he became an aeronautical engineer, assisting in construction of the British government's airship *R100;* as chief engineer of the vessel he accompanied it on a voyage to Canada and back to England. He then turned his attention to aircraft construction, and was managing director of a large company in this field at the time he resigned in 1938 to devote his entire time to literature. His first books had already been well received: *Marazan* (1926); *So Disdained* (U.S. title *The Mysterious Aviator,* 1928); and *Lonely Road* (1932); these were followed by *Ruined City* (U.S. title *Kindling,* 1938); and *What Happened to the Corbetts?* (U.S. title *Ordeal,* 1939). This last book was a choice of the Book-of-the-Month Club, New York City; and the Literary Guild selected its successor, *An Old Captivity* (1940) for publication. After completing *Landfall; a Channel Story* (1940) he joined the Royal Navy for service in World War II, with the rank of lieutenant commander. He was employed at the British Admiralty. During the war period he published two more books: *Pied Piper* (1942), which was made into a motion-picture with Monty Woolley in the leading role; and *Pastoral* (1944).

SHUTTLE, an instrument used by weavers for shooting or passing the thread of the weft from one side of the web to the other, between the threads of the warp. It is a boat-shaped piece of wood which carries a bobbin or cop containing the yarn of the weft or woof. The shuttle sometimes has wheels to facilitate its motion.

SHUTTLEWORTH, Edward Buckingham, Canadian bacteriologist and chemist: b. Sheffield, England, 1842; d. June 24, 1934. He was educated at Dublin and at the Royal School of Mines, and, removing to Toronto, Canada, he became identified with the development of the chemical industry. In 1866 he was one of the founders of the Canadian Pharmaceutical Society, which later became the College of Pharmacy; he served it as dean and professor of chemistry in 1882–1891. He was also a member of the medical faculties of Victoria and Trinity universities, and of the Ontario Medical College for Women. He was city bacteriologist of Toronto before retiring in 1907.

SHYLOCK, a character in Shakespeare's *Merchant of Venice.* He lends Antonio, a merchant of Venice, 3,000 ducats on condition that in the failure to pay in three months the forfeit shall be a pound of the merchant's flesh cut off wherever Shylock chooses. His purpose is defeated by Portia, representing a young lawyer equipped with the opinion of Bellario, a learned doctor of Padua. Up to the time of Charles Macklin (q.v.), who played Shylock in 1741, the part had been represented by the low comedian, and was given a broadly humorous interpretation. Macklin invested it with tragic qualities and represented the Jew as a revengeful, inexorable moneylender. In 1814 Edmund Keane (q.v.) presented the part so as to elicit sympathy for one who was ill-used by circumstances. Modern opinion concurs in that he was the victim of a quibble and that even on the point of his conspiracy against the state his conviction was of doubtful propriety.

SI KIANG, sē kyäng (Chinese for West River), a river in southeast China, most important of those streams uniting to form the coastal delta on which stands Canton. It rises in Yunnan Province and flows in an easterly direction through Kwangsi, receiving many tributaries and in sections having differing names. The approximate length is 1,650 miles.

SIA, sē'ä, **INDIANS.** See Keresan.

SIAM. See Thailand.

SIAMANG. See Gibbon.

SIAMESE TWINS: b. Bangesau, Siam, May 1811; d. Mount Airy, N. C., Jan. 17, 1874. The name given to two individuals of Chinese extraction, named Chang and Eng, who from the manner of their physiological connection were regarded as examples of "anterior duplicity." They grew to be about five feet two inches in height, could walk, run, and swim. In April 1829 they were taken to the United States and exhibited throughout that country and later in Europe. They became American citizens, married two sisters in 1843, and finally settled at Mount Airy; they lived there until their deaths.

The original twins were succeeded by Rosa and Josepha Blazek, born in 1878 in Skerychov, Bohemia. They lived in Czechoslovakia and toured Europe in 1921. Then, visiting the United States, they contracted jaundice and died in Chicago, Ill., on March 30, 1922.

SIAN, sē'än', China, capital of Shensi Province, also known as Changan, Singan, or Hsi Gnan Fu, and by various other names. It is situated on the river Wei, in the central portion of the province. Kwan-chung, which stood on the site of Sian, was the capital of Shih Huang Ti (259–210 B.C.), fourth Chinese emperor of the Ch'in dynasty. The city became famous through the discovery in 1625 near the western suburban gate of the Nestorian monument, dated 781, a two-ton limestone stela, 10 feet high, with an inscription of more than 2,000 characters in Chinese and Syriac (Estrangelo). The inscription tells of the arrival in 635 of Nestorian missionaries from Syria, who were well received by Emperor T'ai Tsung. In 1907 the Danish explorer, Frits Holm (q.v.), set out to try to procure the tablet for science, but the mandarins at Sian caused the stone to be removed into the Peilin or Stone Coppice inside the city walls where it would be safe and under roof. The Holm expedition thus preserved the stela for all ages. The expedition later obtained a perfect limestone replica of the monument, 10 feet high and weighing two tons, which was brought to New York, where it was placed as a loan in the Metropolitan Museum of Art; subsequently it was moved to the Lateran, in Rome. "Ching-chiaopi" is the Chinese name of the tablet. Sian was again the capital of China for nine months, in 1900–1901, when the emperor and empress dowager fled thither from Peking during the Boxer troubles. In May 1949 Sian was captured by the Communists. Pop. (1936 est.) 188,291.

SIARGAO, sē-är-gä'ō, an island of the Philippines, 20 miles from the northeast coast of Mindanao; length, 20 miles, north and south; width, 14 miles; area, 176 square miles. It is traversed from north to south by a mountain range, the highest peaks of which are in the south. The northern, southern, and western coasts are paralleled by a reef lying three miles off shore; the ports on the coast are reached by natural channels through this reef. The island has seven towns, several hamlets, and a considerable rural population.

SIBBALD'S or BLUE WHALE. See Whale.

SIBELIUS, sĭ-bā'lĭ-ŏŏs, **Jean Julius Christian,** Finnish composer: b. Tavastehus, Dec. 8, 1865. During 1889–1890 he studied in Berlin under Albert Ernst Anton Becker (1834–1899), and for the next year in Vienna under Karl Goldmark (q.v.). In 1893 he was appointed a professor at the Helsingfors Conservatory, of which he later became principal. His work as a composer placed him at the head of living Finnish masters and he was regarded as a worthy successor of the greatest names in the history of Finnish music. Termed the founder of Finnish national music, his work is singularly free from the influence of foreign composers. His compositions were strong, passionate, mystic, and at times even weird, and not easy of comprehension to those unacquainted with Finnish character and history. He was thoroughly imbued with the music of the native folk songs, and while he never definitely followed themes of the folk music he rarely strayed away from its influence. Particularly was this noticeable in his use of five-four rhythm and of the repetition of single notes, both characteristic of the native music.

Among his works are symphonies in E and in D; 'The Swan Song of Tuonela'; 'Suite Karelia'; 'Kuolema'; 'Suite Pelleas and Melisande'; the Finnish opera 'The Maid in the Tower'; 'Valse Triste'; violin concerto in D, and many songs, symphonic poems, and pieces for piano and orchestra.

SIBERIA is broadly the northern Asiatic part of Russia east of the Ural Mountains and the Caspian Sea, extending uninterruptedly from the Urals eastward across 130° of the meridian to the Pacific Ocean, thus occupying the whole of northern Asia above lat. 50° N., lying mainly between 46° and 78° N. lat. and 60° and 190° E. long. Siberia is bounded on the north by the Arctic Ocean; on the east by the Bering Strait, North Pacific Ocean, Sea of Okhotsk and the Sea of Japan; on the west by the Ural Mountains and European Russia; and on the south by an irregular frontier line of over 6,000 miles separating it from Iran, Afghanistan and Mongolia. Siberia has a total area of 5,000,000 square miles. In imperial times Siberia was divided into governments and provinces. There were four of the former (Irkutsk, Tobolsk, Tomsk and Yeniseisk) and six of the latter (Amur, Kamchatka, Primorskaya, Sakhalin, Transbaikalia and Yakutsk). Many territorial regroupings took place following the second Russian revolution. The name «Siberia» is also used in a narrower sense to designate one of two distinct groupings of the autonomous areas and republics that go to make up the Asiatic domains of Soviet Russia: 1. Soviet Central Asia; and 2. Siberia.

1. Soviet Central Asia is bounded on the north by European Russia, the Ural Area, the Siberian Area, and the Oirat Autonomous Area; on the east by Mongolia and Tibet; on the south by Afghanistan and Persia; and on the west by the Black Sea and European Russia. It is composed of

Transcaucasian S.F.S.R.	Tajik S.S.R.
Uzbek S.S.R.	Kirghiz A.A.
Turkoman S.S.R.	Kazak A.S.S.R.

2. Siberia is bounded on the north by the Arctic Ocean, on the east by Bering Sea, the Sea of Okhotsk and the Sea of Japan, on the south by Mongolia and the Autonomous Kazak Republic, and on the west by European Russia. It comprises

Far Eastern Region	Siberian Region
Yakutsk Republic	Baskhir Republic
Buriat-Mongol Republic	Ural Region

The principal cities of the Siberian Region Proper are the capital, Novo-Sibirsk (population 120,701); Omsk (161,475); Tomsk and Irkutsk (about 100,000 each); Barnaul and Krasnoyarsk (about 75,000 each); and Buisk (46,000). The Siberian region, extending from the Arctic Ocean to Mongolia, has a variety of climate, with fertile agricultural districts, forest land, and sections adapted to industries of various sorts, particularly coal mining. There are rich coal areas, and iron and copper deposits.

Topography.—Siberia in its broader connotation is vast and diversified. Whereas the southwestern part is entirely lowland, the southern and eastern portions comprise considerable highland tracts. The coast line (19,300 miles) is very extensive, but the Arctic Ocean is ice-bound at least 10 months out of the 12 and is almost valueless for commercial purposes, while the Sea of Okhotsk, on the Pacific, is infested with masses of floating ice and dense fogs during several months of the year. Asiatic Russia in the extreme southwest is partly below the level of the ocean, and is drained either into the Caspian, or by the Amu Daria and Sir Daria into the Aral. A large part of this region is desert, and the soil is frequently impregnated with salt. Taking the meridian of 105° as a line of demarcation, two regions will be formed—a western and an eastern, exhibiting a very marked difference in the configuration of their surface. Both regions have their greatest altitude in the south, and may be considered as a vast inclined plane, sloping gradually north to the Arctic Ocean; but the eastern region is traversed in different directions by several mountain regions, whereas the western region, with the exception of the chain of the Ural on the western, and that of the Altaï on the southern frontiers, forms a vast plain, almost unbroken by any greater heights than a few hills and the banks of the rivers which wind across it. This plain, towards the south, has a height of about 2,000 feet above the sea, but toward the north is so near its level as often to become extensively inundated. The steppe, occupying the most elevated part of the plain, extends from the southern frontiers north to lat. 55°; and from the western frontiers, within these limits, east to the banks of the Irtish. The greater part of it consists of what is called the Steppe of Ishim, and has a bare and almost sterile surface, often incrusted with salt, but also occasionally covered with a scanty vegetation. The agricultural division extends northward to about lat. 60°. In many parts where it borders on the steppe, it has much of the same character, and has only occasional tracts which have been or can be advantageously brought under the plow; and in many other parts primeval forests are often found. Within this division, though not properly belonging to it, is the Steppe of Baraba, situated between the Irtish and the Obi. It has a more abundant vegetation than the Steppe of Ishim, which it otherwise resembles, and in its northern portion is covered with nearly continuous forests of birch and fir, haunted by numerous wild animals, including the beaver. From this the wooded division extends northward to lat. 64°, and in parts to 66°, though in the higher latitude the trees are seldom of very vigorous growth. The whole of this division is covered with vast forests of birch and different species of fir and pine. The population, few in numbers, are settled chiefly on the banks of the Obi and Yenisei, and live mainly on game and fish; the latter, including salmon, sturgeon and herrings, ascending from the sea as far as the confluence of the Tom. Wild animals also are very numerous, and many valuable furs are obtained. The last division is that of the moorland or tundra, consisting of a low monotonous flat covered with moss, and nearly destitute of trees. It extends along the shores of the Arctic Ocean, and has so rigorous a climate that even in summer ice is found a few inches below the surface. Here the reindeer exist in vast herds, both wild and domesticated; white bears and foxes are also numerous and furnish valuable furs; and the coasts and mouths of the rivers

are frequented by immense shoals of fish and flocks of fowl.

Siberia to the east of long. 105°, forming nearly one-half of the whole territory, has a much more diversified surface than the western region, and owing partly to its general ruggedness and elevation, and partly to the greater severity of its climate, has much less land adapted for agricultural purposes. The Sea of Okhotsk has a bold and rocky shore, and the country behind rises with a steep ascent till a mountain-range is formed, with a general altitude of nearly 3,000 feet above sea-level. This range, under the name of the Stanovoi Mountains, runs nearly parallel with the coast till it reaches the frontiers of China, where it takes the name of the Jablonnoi Mountains, and proceeding west continues for a long distance to form the boundary between the two empires. It then takes the name of the Mountains of Daouria, and throws out numerous ramifications, which, continuing west, throw their arms round Lake Baikal, and cover almost all the south part of the government of Irkutsk. Other ramifications, proceeding north, form the watersheds of the numerous affluents of the right bank of the Lena. On both sides of this river the surface continues elevated, and forms a table-land, the interior of which is still very imperfectly known. The best portions of eastern Siberia occur in the south of the government of Irkutsk, where, in the lower and more open valleys in the vicinity of Lake Baikal, cultivation has been attempted with success, and the oak and hazel, unknown in other parts of Siberia, are found growing freely. In almost the whole of the same government, where the configuration of the surface does not present invincible obstacles, all the grains of Europe are grown, and even the mountains and hills are covered during the greater part of the year with good pasture. Still farther north, in the government of Yakutsk, as far as the town of same name, corn is cultivated in patches in the upper vale of the Lena, though the far greater part of it is covered with fir and pine. The north part of eastern Siberia consists of two distinct portions, the one extending from long. 105° E. to the lower valley of the Lena, and the other from that valley east to Bering Sea. The former portion is imperfectly known: the latter, as far as the Kolyma, is traversed from north to south by chains of low hills, separated from each other by wide valleys or open plains, and generally overgrown with stunted larch and birch. In these valleys and plains are numerous lakes, generally well supplied with fish, and bordered by low banks, on which a rich grassy sward is often seen. To the east of the Kolyma branches from the Stanovoi Mountains stretch north, and form a series of ranges which frequently rise from 2,000 feet to 3,000 feet. Some of these penetrate to the north coast, and are seen forming precipitous cliffs at Shelagskoi Nos, Cape North, and other headlands. Other ramifications from the Stanovoi pursue an opposite course, and traverse the remarkable Peninsula of Kamchatka almost centrally to its southern extremity.

Hydrography.—There are numerous great rivers in Siberia. From the configuration of the country they almost all flow northward and belong to the vast basin of the Arctic Ocean. The chief exceptions are the Anadir and the affluents of the Amur in the east, and the Sir Daria, Amu Daria and other streams in the southwest. The great rivers belonging to the basin of the Arctic Ocean flow for the most part through immense tracts of level country, and hence are remarkable at once for the length of their course, the volume of water they accumulate and the few obstacles they offer to continuous navigation. But these advantages are offset by the long period during which they are frozen over, though even then they are available for traffic and become, in fact, the great highways of the country. The Obi is one of the largest rivers in the world; the length of its course is 2,400 miles and the area of its basin is 1,224,435 square miles. This system affords no less than 16,869 miles of navigable waters. Among its important affluents, many of them so large as to be entitled to rank as magnificent rivers, are the Irtysh, Ishim, Tobol, Tom, Tchulin and Ket. The Obi estuary forms a gulf of from 70 miles to 80 miles wide, and about 400 miles long. Large quantities of fish are taken in this river and its tributaries. The Yenisei, the second river in importance, draws its waters from an area of not less than 1,020,000 square miles. It rises in Northern Mongolia and flows north a distance of over 2,000 miles to the Arctic Ocean. Its most important affluents are the Selenga, which, before entering Lake Baikal, drains an area of more than 140,000 square miles; the Angara, which receives the discharge of the lake, and in the lower part of its course takes the name of Upper Tunguska; the Middle Tunguska, and the Lower Tunguska. The estuary of the Yenisei is about 20 miles wide, and 200 miles long. The Lena has a course of about 2,000 miles, and drains an area of about 800,000 square miles. It rises hardly 20 miles to the west of Lake Baikal, and becomes navigable at 50 miles from its source. Its principal affluents are the Vitim, which has a course of 700 miles, of which a considerable part is navigable; the Olekma, which flows 500 miles through interminable forests; the Aldan, which drains an extensive tract of table-land between long. 125° and 140° E.; and the Viliui, which rises in a mountainous district not far from the Lower Tunguska, and flows west for about 600 miles. The Amur, formed by the junction of the Shilka and Argun rivers, is, with its Argun headstream, about 2,800 miles long and covers an area estimated at 2,000,000 square miles. The Amur River system is navigable for some 8,000 miles. The most important of the minor rivers which send their waters directly to the Arctic Ocean are the Olenek, between the Yenisei and Lena; and to the east of the latter, the Indighirka and Kolyma. The only important lakes are those of Baikal, 400 miles long and in places 50 miles wide; the Sea of Aral, and Balkash-Nor or Tenghiz, in the southwest.

Geology and Minerals.—Granite and crystalline schists are found chiefly on the eastern slopes of the Ural Mountains, in the south among the mountain-ranges of the Altai as far north as lat. 57° N., and between long. 85° and 120° E., chiefly in the governments of Tomsk and Irkutsk, on both sides of the Upper Tunguska and east of the Yenisei; in the upper part

of the basin of the Middle Tunguska; and in the very eastern extremity of the country, from long. 165° to the shores of Bering Strait. The volcanic rocks belong mostly to the Tertiary period, and are found chiefly in the south, in connection with the granite and crystalline schists above mentioned. They compose the great mass of the mountain-range which skirts the western shores of Lake Baikal, and are seen in a still more magnificent and interesting form in the mountains which proceed from north to south, nearly through the centre of the Peninsula of Kamchatka, where are several active volcanoes. Palæozoic rocks, including the rocks belonging partly to the Silurian, partly to the Devonian, and partly to the Carboniferous systems, are developed chiefly in the south, where they occupy a large space in the form of a triangle, the apex of which is at the town of Irkutsk, and the base on the parallel of 60°, between long. 85° and 120° E. Another large development of the same rocks is seen on the northwest and north of the Sea of Okhotsk, and to a considerable distance inland. Secondary rocks higher in the series than the Carboniferous system commence near the northern shores of Lake Tenghiz, and stretch northward, occupying a considerable tract on both sides of the upper valley of the Irtish; a more partial development of the same rocks is seen on the north of the Obi, commencing near the confluence of the Ket, and extending north in a comparatively narrow belt to the sources of the Taz. The most extensive formation in Siberia is the Tertiary, which stretches almost continuously from the last slopes of the Ural Mountains east across the Obi to the valley of the Yenisei; and in other quarters, though more intermingled with earlier formations, covers no inconsiderable portion of the whole surface. The shores of the Arctic Ocean, almost throughout their whole extent, and to a considerable distance inland, have a deep alluvial covering, remarkable for containing deposits of fossil elephants and other animals in such quantities that the ivory obtained from them forms an important article of commerce. The minerals of Siberia are evidently of immense value, and though the real extent of surface on which they are found is as yet only roughly guessed at, there cannot be a doubt that the most precious of all the metals exists there in greater abundance than in any other part of the Old World. Till recently the auriferous deposits were supposed to be almost confined to the eastern slopes of the Ural Mountains, and to occupy a zone extending over from 5° to 6° of latitude to the north and south of Ekaterinburg; but it has been discovered that some of the eastern regions, particularly in the governments of Tomsk and Yenisei, are highly auriferous, and that a tract larger in area than the whole of France contains gold, not in its alluvia, but in the very matrix of its rocks of palæozoic schists and limestones, which, when pounded and analyzed, are found to be more or less impregnated with gold. The principal mining districts are those of the Ural already mentioned, the Altaï and Nertchinsk, in the basin of the Amur. Besides gold, of which Siberia has Russia's richest deposits, and platinum, of which new supplies have recently been found at the mouth of the Yenisei, iron, copper, zinc, silver, tin and lead are found in varied amounts. There are vast areas rich in coal and iron still unexploited. Among the more important minerals unearthed in Siberia must be mentioned the topaz and the emerald, at the famous mines at Nerechinsk.

Climate.—The prevailing impression that, climatically, Siberia is but a huge refrigerator, is absolutely erroneous. Being vaster in extent than the whole of the North American mainland, Siberia naturally possesses a great variety of climate — warm and hot, as well as the extremes of cold. Whereas the region between the Arctic Circle and the Arctic Ocean is a frost-bound waste growing only Arctic mosses and lichens—tobacco, cotton, even grapes and watermelons are successfully raised in certain parts of Southern Siberia; while residents speak enthusiastically of its beautiful springtime. And this is not to be wondered at if we remember that much of Siberia lies as far south as the States of Virginia and Kentucky, and that summer temperatures exceeding 100 degrees Fahrenheit are not uncommon there. Indeed, some travelers dread Siberia's peculiar summer heat more than its winter cold. The isothermal line skirting the southern coast of Iceland, in proceeding east, descends rapidly until it reaches Leningrad, and then more gradually till it reaches long. 100° E., where it is found in lat 52°. From this it proceeds nearly due east, passing through the southern part of Lake Baikal, the town of Nertchinsk, and the southern extremity of Kamchatka. Thus in proceeding from west to east the cold increases so much as to make places in the same latitude as Berlin to have a climate nearly as cold as Iceland. Erman found that annually between 17 December and 18 February, most frequently in the first three weeks in January, cold is experienced exceeding 90° F. below zero, and that for two months—a sixth part of the year—mercury is solid. This extreme winter is followed by a very warm summer. Thaw usually commences on the 1st of April, and the temperature increases rapidly till it attains its maximum in July. In this month the average height of the thermometer is about 66° F., but it not unfrequently rises in the shade above 77°. In Yakutsk, where the cold is severest, notwithstanding its long and extreme winter, there are 128 days in the year without frost; and within that period several kinds of grain, not excluding wheat, have time to attain maturity; and in rich alluvial soils often produce a return of fifteenfold.

Manufactures and Commerce.— The manufactures are limited, and are confined for the most part to a few of the larger towns, where government factories have been established. The more important articles are leather, earthenware, porcelain, glass and hardware. In some places, as at Telma, large woolen and linen factories employ a considerable number of hands, many exiles, in weaving woolen and linen cloth, and in conducting all the previous processes of preparing the wool, flax, etc. The trade is of considerable extent; and in so far as confined to the produce of the country consists chiefly of cattle, fish, caviar, furs, skins and metals. A very important transit trade is also carried on across the country between Russia in Europe and China. From the latter part by far the most important article is tea, both in the dried leaf and in the form of cakes

or bricks. The greater part of the latter is disposed of to the nomadic tribes, and a very large proportion of the former never passes beyond the limits of Siberia, but is retained for home consumption. Other articles of importance from China are coarse cotton stuffs, rhubarb, silks, satins, etc. The chief mart for this trade is the town of Kiachta, and extensive fairs are held at various places. For the interior traffic, the rivers afford remarkably good and cheap transportation ways, but their use is limited by their direction (all northward) and the shortness of their open season. Dog and reindeer sledges are therefore much in use. Great impetus was given to commerce and colonization generally throughout the region by the completion of the Trans-Siberian Railway (q.v.), the longest in the world, connecting the Far East with Europe by a 10 to 11 days' journey. A trade route by sea has also been opened between Europe and the Obi and Yenisei rivers.

Ethnology.—The races and tribes scattered over the different parts of Siberia are so numerous that little more can be done here than to give the names of the more important. The earliest inhabitants were probably the Yeniseians, who were followed by the Ugro-Samoyedes; these in their turn were driven out by Turkish tribes, who were ousted by the Mongols in the 13th century. The Trans-Siberian Railway has greatly stimulated Siberian immigration, so that the population of Siberia is largely Russian. Long before the railway days, all through the 19th century, there had been considerable Russian immigration to Siberia; over half a million in 1904 alone and 1,500,000 between 1890 and 1905. This constant and still flowing stream of free Russians had been fostered by the government since 1894; in addition, great hordes of exiles banished under the imperial regime for centuries, had swelled the population by some 865,000 between 1807 and 1899. Curiously enough, it was these exiles, far fewer in numbers than the free immigrants, that have branded the whole of Siberia with the undeserved, disreputable stigma that has marked it long after it ceased to be—in a few isolated parts only—a penal colony. Ethnologically, the Siberian natives present more varied and interesting types. Beginning at the Ural Mountains and proceeding eastward we find the Samoyedes in the northwest. Immediately south of them, the Ostiaks occupy both banks of the Obi, up to the confluence of the Irtysh, the northern part of the steppe of Baraba, and the whole of the woody region eastward to the banks of the Yenisei. They live by fishing and hunting, and though their physical structure is by no means robust, they display both great dexterity and courage in attacking the larger and fiercer animals, both of the land and water. Some of them have embraced Christianity. In the south, among the Altaï Mountains, the Kalmucks predominate. They subsist chiefly on the produce of their horses, cattle and sheep, and cultivate a little grain and tobacco. They have some skill in mechanical arts, especially in the working of iron, and make their own gunpowder. They are addicted to superstitions. Among the eastern slopes of the Altaï are several Turkish tribes. The Buriats dwell chiefly on both sides of Lake Baikal, and eastward as far as the Onon. They are of Mongol origin, and closely allied to the natives of the northern provinces of China both in language and customs. The Tunguz or Toongooses are the most widely dispersed of all the native tribes, being found throughout many parts of Siberia from the Arctic shores to the frontiers of China. They are considered the best-formed of the native Siberians, are very expert horsemen, and live chiefly by hunting. The Yakuts live intermingled with the Tunguz, and confine themselves almost entirely to the rearing of horses and cattle, and the preparation of dairy produce from them. They are of Tartar origin, and not a few of them are nominal converts to Christianity, though the majority, like the Tunguz, still adhere to Shamanism. The Tchuktches occupy the northeastern portion of Siberia, and their language proves them to have a common origin with the Eskimos. Some of them spend their time in hunting and fishing, while others are nomadic in their habits. Interesting and valuable information on these tribes was collected by the Morris K. Jesup Expedition which returned to the United States in 1904.

History.—Siberia appears to have been partly conquered by Ghenghis-Khan and his successors, but did not become known to Europe until 1580, when a Cossack called Ermak Timofeev, who had long robbed the vessels which navigated the Volga, finding himself hotly pressed by the czar of Moscow, crossed over into Asia with his accomplices. Their number sufficed to form a small army, and their courage soon enabled them to acquire extensive settlements. These Ermak offered to the czar on the condition of obtaining pardon. The offer was accepted, and thus Russia for the first time obtained a footing in Asia. The territories thus conquered belonged to the Tatar prince Kutshum-Khan, and included his residence, which, called by the natives Isker, and by the Cossacks Sibir, has given name to the whole country. The conquests of Ermak were gradually extended, until the whole country west of the Obi was subjected to the czar. In 1604 the town of Tomsk was founded, and became a center from which new expeditions were fitted out and new conquests made. Private adventurers, instigated chiefly by the hope of plunder, proceeded in all directions to the south, where, not without serious reverses, they succeeded in expelling the Kirghiz; and to the east, where they entered the basin of the Lena, subdued the Yakuts, and finally, after passing the Aldan Mountains, reached the Sea of Okhotsk. In the neighborhood of Lake Baikal a formidable resistance was made by the Buriats, but their subjugation was finally completed in 1658. The town of Nertchinsk, which has since become so celebrated for its mines, was then founded, and, two years after, that of Irkutsk. A further extension of conquests to the south brought the adventurers into collision with the Chinese, and both governments taking part in the quarrel, a war, threatening the existence of one or other of the empires, became imminent. It was, however, prevented, partly by the intervention of the Jesuits resident at Peking, and a treaty in 1689 definitely fixed the boundaries of the two empires. A second treaty in 1727, confirming the former, regulated the commercial intercourse and confined it to the two localities of Kiachta and Maimachen. Never has so large a territory been acquired at so little expense. Russia, almost without any expenditure of her own means, and chiefly by the aid of a few Cossack adventurers, in little more than a cen-

turv more than doubled her area. An enormous part of it indeed is a frozen inhospitable region, which must always remain comparatively worthless; but vast tracts possess a climate and soil well adapted for agriculture, and seem destined to become the abodes of a dense population engaged in agriculture, mines and fisheries.

With the building of the Trans-Siberian Railway (1891–99) emigration from Russia to Siberia became easier and was patronized by the government. Whereas in former times the annual influx of new settlers was from 20,000 to 30,000, with the opening of the railway it rose at once to from 150,000 to 200,000. During the Russo-Japanese War it was interrupted, but many Russian peasants who had been called up for military service then first made acquaintance with Siberia. No sooner was the war over than the wave of emigration rose to an unprecedented height. In 1907 the number amounted to 576,979; in 1908 there were 758,-812; in 1909 there were 707,463. Since then emigration has progressed, though reliable statistics are not available. The advent of labor and money, and the establishment of new farms has transformed all the old conditions of the country. Even the nomad Kirghiz have been aroused from their lethargy by the gradual narrowing of pastures and have taken to plows and reaping-machines. New towns have arisen in Siberia, new industries have started; the Zemsto system was introduced in 1905, while a uniform system of public justice—in place of the existing arbitrary administration of autocratic officials—was instituted in 1897 by order of the ex-Tsar Nicholas. Trial by jury was not conceded but the justices were appointed by the Crown. The higher tribunals consisted of eight circuit courts in the towns of Tomsk, Tobolsk, Chita, Krasnoyarsk, Irkutsk, Yakutsk, Blagovestchensk and Vladivostok, with a court of appeal above these stationed at the provincial capital, Irkutsk. The Soviet system now obtains. A sea route through the Kara Sea to Siberia has in recent years been opened up, chiefly by British enterprise.

Siberia has an unenviable record owing to its famous convict settlements. It was in 1710 that Peter the Great first began exiling inconvenient political opponents to the bleak steppes beyond the Urals, but it was not till the first quarter of the 19th century that it became a common practice to deport criminals to Siberia in addition to political offenders. In later years a stream of emigration was directed thither and encouraged. While those prisoners who were regarded as dangerous were chained and forced to work in lead mines, those accused of minor offenses (who were frequently accompanied by their families and friends) were permitted to live in comparative freedom, running stores and workshops on their own account. Some European visitors have even brought back stories of female political exiles who had their own pianos and read the latest French novels. The squalid horrors of the convict system are described in numerous travel books and especially in Russian fiction.

The tangled skein of events that developed in Siberia between the period of the Russian Revolution in March 1917 and the summer of 1919 presents a confusing panorama, of which it is only possible here to give a more or less approximate description. In a sense the Siberian imbroglio of 1918–19 was not so much a part of the Great War as a side issue that arose from it and from the Revolution. It may better be described as a civil war accompanied by half-hearted experiments in foreign intervention. Beginning as a struggle in favor of the Allies after the military collapse of Russia, it developed into a far-flung campaign against Bolshevik rule. In the early stages of the European War whole regiments of conscript Slavs — Czechs, Slovaks, Croats and Poles — in the Austro-Hungarian army deserted over to the Russian side. Though living under foreign dominion for centuries, these races had clung tenaciously to their national culture and languages. Their sympathies in the war lay with their Slavic kinsmen in Russia as against the Central Powers. Out of these deserters a Czecho-Slovak division had been formed after the Revolution and incorporated with the Russian army. It played a gallant part in the last offensive that Brussilov was able to direct against Austria before Bolshevism succeeded in demoralizing the Russian troops and navy. The Czecho-Slovaks, however, insisted on continuing the war, and demanded to be sent to France to join the Allies. The Bolshevik rulers were willing that they should leave Russia, and in February 1918 they were granted a passage to Vladivostok; but before their removal could be effected Trotzky had concluded the Brest-Litovsk Treaty with Germany (3 March 1918) and the bulk of the Czecho-Slovaks, some 50,000 at that time in the Ukraine, found themselves in danger of falling into German hands. Refusing to make peace and unable to face the German advance, they decided (after rejecting Austrian overtures to return home and be forgiven), to retreat over the railroad to Moscow and make their way thence across Siberia, across the Pacific Ocean and America to France. Hunted by the Germans, they fought a four days' battle at Bakhmach, 125 miles northeast of Kiev, defeating them severely. Under tremendous difficulties they continued their amazing journey eastward; they cut their way through and, to prove their loyalty to the government then in being, surrendered most of their equipment to the Bolsheviki, leaving also hundreds of automobiles and air planes to the Germans. Though betrayed time and again by Bolshevik treachery, their wounded murdered, attacked daily by Red Guards and Austro-German prisoners led by German agents, they at first steadfastly refused to fight against Russians and to interfere in Russian politics. After 56 days' of toil and hardships, the vanguard of this modern "Ten Thousand" completed its "Anabasis" and reached the Pacific — one of the greatest military achievements in history. Other detachments of Czecho-Slovaks remained in western Siberia and on the road to Archangel.

On 14 March 1918, Mr. A. J. Balfour pleaded in the House of Commons for Allied assistance in Siberia against the growing menace of German penetration owing to the presence of some 94,000 Austro-German prisoners of war east of Lake Baikal, and 60,000 to the west of the lake. He strongly defended the loyalty of Japan to her allies and suggested that that country should be invited to intervene "as

friends of Russia and enemies of Germany, to preserve the country from German domination.» The Japanese Foreign Minister, Baron Goto, stated on 1 May that «Japan must give encouragement, assistance and support to the work of reorganization» in Russia and «preserve peace in the Near East.» Negotiations between the Allies followed at length while events shaped their own course in Siberia.

To return to the Czecho-Slovaks. The Bolsheviki had promised them a «safe conduct» and transportation, neither of which materialized. Acting under German pressure, Trotsky ordered them to be disarmed. This was forcibly attempted in May, when the Czechs resisted and attacked the Bolshevik troops both in Europe and in Siberia, captured several towns on the Volga during June, occupied Samara and advanced to Ufa in the Ural region. They seized control of the principal grain routes, thereby cutting off the food supply from Siberia. Scattering the Bolsheviki before them, they fought their way along the Siberian Railway, and by July were in possession of the line from Chelyabinsk in the Urals to Krasnoyarsk, a distance of over 1,300 miles. Meanwhile, a large contingent of Czecho-Slovaks had arrived in Vladivostok, the eastern terminus, from which point they began operating westward to effect a junction with their comrades. The Bolsheviki were driven out of Vladivostok and Irkutsk by the end of June. The Czechs entered the Amur region and occupied several towns, and by the middle of July nearly the whole Trans-Siberian Railway was in their hands. In each of the towns at which they arrived they found a Soviet local government of Workmen's and Soldiers' Delegates, in other words, Bolshevik rule. Each of these was immediately overthrown, at which task the Moderate Russians or anti-Bolshevists heartily assisted.

After the Bolsheviki had dispersed (January 1918) the Constituent Assembly in Moscow, many of the members made their way into Siberia, where they secretly maintained their organization under the Red rule. The coming of the Czechs gave this group their chance. Its members established the Temporary Siberian government at Omsk on the ruins of Bolshevism in central Siberia in June and began to organize a Russian anti-Bolshevist army. Other governments sprang into existence later on: General Horvath, director of the Chinese-Eastern Railway, established a provisional government at Harbin; General Semënov founded one in Chita, and Avksentiev created the Ufa Convention, while yet another Siberian government arose at Novo-Nikolayevsk in western Siberia. A branch of the Omsk government was set up in Vladivostok. Before long trouble arose between this multitude of «independent governments,» each claiming either «All Russia» or «All Siberia» as within its jurisdiction. Allied influence was exerted to settle the local rivalries. By arrangement the Ufa Convention was dissolved and merged in the Omsk government, under a directorate of five members: Avksentiev, Vinogradov and Vologodsky (Socialists), Astrov (Cadet), and General Boldereff (non-party), as commander-in-chief. Admiral Kolchak was appointed Minister for War and Marine; 10 other ministerial posts were created, for Foreign Affairs, Interior, Finance, Justice, Communications, Munitions, Labor, Commerce, Supplies and Education. Political intrigue soon made its appearance among the central committee which threatened to lead to confusion and disintegration when the council of ministers decided to take the authority of the Directorate into its own hands. Soon after his appointment Admiral Kolchak proceeded to the front on a tour of inspection. Just at that time the Czech commander had invited the British 25th Middlesex Battalion to attend the presentation of colors to the Czech regiments at Ekaterinburg in the Urals, and Col. John Ward, an English Labor member of Parliament, had accepted for the band and 100 men of his battalion. Railway traveling being a difficulty in Siberia, the admiral's carriage was attached to the British troop train, and Colonel Ward offered his men as the admiral's escort for the whole trip around the front. Thus it happened that the Russian War Minister inspected his troops with no other guards than British soldiers, who duly accompanied him to the front and marched up to the outpost line with the band playing 'Tipperary.' The tour ended abruptly at Chelyabinsk; instead of going west to Ufa according to program, the admiral and his escort suddenly turned east at top speed for Omsk. On the road they encountered a special train bearing General Boldereff, who held a long private consultation with Kolchak. On the morning of 17 Nov. 1918 they were back in Omsk, and that same night Avksentiev, two other members and the chief of police mysteriously disappeared. Next morning the streets were alive with troops. A batch of officers had spirited the administrators away during the night. There was little doubt that the military party meant shooting. Colonel Ward immediately wrote a bluntly-worded letter to the admiral intimating that British public opinion would regard with profound disapproval any attempt to deal with the arrested men except by proper trial. Kolchak at once gave the required assurances, and two days later the four men were entrained for China under a joint British and Russian guard, and with the train flying the British flag as a precaution. With Boldereff perspicaciously absent and the extreme Socialists arrested there remained but two of the Directorate, Vologodsky and Vinogradov, who promptly resigned their offices and the Directorate became extinct. The council had now to decide whether to retain power itself, which virtually meant a resuscitation of the Siberian government, or to vest it in something or somebody else. The whole procedure was no doubt cut and dried in advance. The council formally assumed the power, fallen upon it by the disappearance of the Directorate, and immediately offered it to Kolchak with the title of «Verkhovnü Pravitel» (Supreme Administrator), virtually dictator. Kolchak accepted, thereby completing the *coup d'état*.

Already in April 1918 some British and Japanese marines had been landed at Vladivostok to maintain order. A Chino-Japanese agreement (16 May) assured the co-operation of China to combat German penetration in Siberia. Early in August a small British force landed at Vladivostok to co-operate with an American

detachment and a larger Japanese force; active intervention had been decided upon after lengthy negotiations between the Allied Powers. Declarations were formally made by the American and Japanese governments that the movement of Allied troops into Siberia was not an act of hostility against the Russian people, but an intention to assist them. The Allied force was placed under the command of the Japanese General Otani; besides those already mentioned, his force consisted of French, Italian, Serbian and Rumanian units. Maj.-Gen. W. S. Graves was in command of the American contingent, consisting of two regiments from the Philippines. A British plenipotentiary for Siberia was sent from Hongkong. The Bolshevik government declared the Allied intervention in Siberia to be an act of war against Russia while the Moderates welcomed it as the only feasible measure to crush Bolshevism and to disabuse the Germans of the idea that the road eastward lay open to them. In the fighting along the Siberian line the Czechs and the Russian White Guards gained numerous successes over the Bolshevist forces. In the Far East, however, the operations of the Allied armies did not for some time extend beyond the Amur and Ussuri province north of Vladivostok. By the middle of August 1918 the situation became complicated. The Czechs held the line from the Urals to Irkutsk; the Allies controlled part of the Ussuri region. Between the two lay a formidable army of Bolsheviki and former Austro-German war prisoners, all well equipped and led mainly by German officers. Other detachments of Czechs, still further west in Russia itself, were hard pressed, while neither the British from the Murmansk expedition nor small forces operating from India up through the Caucasus and Transcaspia, were near enough or strong enough to effect a junction. Even in Ussuri the Czechs were in peril until the Allies and a Cossack force under Semënov were able to reach them. The Japanese captured Khabarovsk (8 Sept. 1918), the base on the Ussuri Railroad of the Siberian Bolsheviki, who then withdrew to Blagoveshtchensk. They were cleared from the railway between Lake Baikal and Manchuria and communication was finally established with the Czechs to the west, though it was for some time impossible to relieve the pressure against them. The Bolshevik army indeed grew ever stronger. Americans and Japanese captured Blagoveshtchensk (14,000 prisoners) and Alexeievsk on 18 September, when 2,000 Austro-Germans surrendered. Most of the fighting, however, was done by the Czechs and Slovaks. A deep and powerful motive lay behind their heroic exploits. Uninterested in Russian internal affairs, they were goaded into opposing the Bolsheviki when the latter openly proclaimed themselves their enemies. They had no desire to upset one Russian régime for another. Their sole aim was the defeat of the Central Powers and the creation of a free and independent Czecho-Slovak state — to liberate their own country. Wherever they appeared the Bolsheviki fled before them and the populations greeted them as friends and liberators, joining them and re-establishing order. The Allied contribution in men was small and the area of their operations was limited.

During August 1917 Siberia had received the most distinguished prisoners recorded in its annals when the deposed tsar, Nicholas II, and his family arrived at Tobolsk, nearly 2,000 miles east of Petrograd. About April 1918 they were removed to the Crimea, and subsequently to Ekaterinburg, the capital of the Red Ural, on the eastern slope of the Ural Mountains. That town, which is strongly fortified, is the key to Siberia, through which the great railway enters Siberia, and here the Omsk government had decided to establish the base for their operations against the Bolsheviki. The Ural Regional (Bolshevik) Council in Ekaterinburg was seriously threatened early in July 1918 by the approach of Czecho-Slovak forces. At the same time an alleged conspiracy to rescue the tsar was reported to have been discovered. "In view of this fact," a Russian official wireless announced, "the Presidium of the Ural Regional Council decided to shoot the ex-Tsar, Nicholas Romanoff. This decision was carried out on July 16." The Czechs occupied Ekaterinburg a few weeks later.

A Russian army was being raised by the Omsk government in the autumn of 1918 under General Gaida (a Czech) and organized by General Diederichs (a Russian). This force, the "White Guards," elected its own officers and was permeated with indiscipline. Furthermore, there was a general lack of confidence in the purpose of the Allies to defend Siberia. Confusion soon arose over the question of authority. German and Bolshevist agents were busy in all Siberian towns. No measures to secure public safety were undertaken owing to lack of co-operations between Russians and Czechs. American, British, French, Japanese and Italian troops were now penetrating Siberia proper from the east. On the night of 16 Oct. 1918 the first *échelon* of the Allied contingent steamed into the station at Zema, in central Siberia, when the train engineer was immediately held up by armed men and threatened with death if he did not vacate his post and join a strike which had just begun. Colonel John Ward commanded the British force. He instantly took over control of the station, marched a detachment into the town, surrounded the house of the strike leader and arrested him, A proclamation was put up declaring that any workman absent from his post next day would be court-martialed. The troops occupied all the workshops and public buildings during the night, and next morning the strike was over. Armed Bolsheviki surrendered their weapons under penalty of death. This resolute action frustrated a deliberate plan to stop the westward transport of Allied troops. A continuous stream of refugees from Russia poured into Siberia in search of food, drifting into crowded towns in a deplorable state of destitution. Sporadic fighting continued to the end of the year. In January 1919 an agreement was arrived at in Tokio for joint Allied control of the Siberian and Chinese Eastern railways, to restore the efficiency of those lines by a committee of American, British, French, Japanese, Italian and Chinese representatives under the presidency of a Russian. About the same time the question of command was settled. Admiral Kolchak was to remain dictator and nominal commander-in-chief and the French General

Janin was given supreme control of the operations against the Bolsheviki. The British General Knox was placed in command of the rear. Labor troubles, mainly due to delayed payment of wages, led to numerous strikes throughout Siberia, hampering both administrative and military activity. Colonel Ward was sent on a mission of investigation from town to town and to address the workmen, Kolchak promising to support any ameliorative measures proposed.

After the armistice with Germany (11 Nov. 1918) public interest in Siberia waned; opposition grew in America and Great Britain against maintaining troops in Russia. Public opinion in Canada agitated for the return of Canadian troops, of whom about 5,000 were stationed at Vladivostok, but had not been in action against the Bolsheviki. In February these were ordered to be sent home in the spring. Many Czechs, Slovaks and Poles were recalled by their new governments.

During January the Russo-Czech forces lost the city of Ufa and Orenburg to the Bolsheviki, but made some gains at Tobolsk, Sarapol and Kungur. The Siberian army began an offensive against the Ural front early in March 1919 and captured the towns of Okhansk and Ossa, both southwest of Perm, and Birsk, north of Ufa. The condition of Siberia at this time was one of chaos, misery, starvation, intrigue and bloodshed, "with the smoldering red terror of Bolshevism awaiting to overwhelm all." While the greatest shortage prevailed in the cities and plains, the wharves of Vladivostok were piled up with supplies from America—cotton, machinery, guns and railroad material. Most of this had been landed before the Revolution, and Allied vessels were still pouring in supplies, the distribution of which was hindered by frequent breakdowns on the railway owing to the destruction of tunnels. During April–May 1919 the Allies made good progress. Kolchak's forces gained several important points on a front of 100 miles and had established contact with the Allied Archangel line. At Tomsk, 50 miles south of Ufa, a whole regiment of Bolshevik cavalry went over and immediately turned their weapons against their former comrades. A few days later a Bolshevik army of 40,000 to 50,000 men seized the valuable Lena Goldfields in the province of Irkutsk, a region lying within the sphere of the Kolchak government. The numerous roving bands of Bolsheviki in the vast spaces of Siberia had never been subdued, and at places remote from the railway were still able to defy the government. For over six months Kolchak had striven in vain to secure the recognition of his government by the Allied Powers. The congress of the Constitutional Democratic party had urged all Russian citizens to unite around Kolchak in the name of the independence of Russia. The Jewish community in the city of Tomsk placed 1,000,000 rubles at his disposal for the army. His government was the only one in Russia approved and recognized by all political parties outside the Bolshevik ring.

The summer of 1919 found the Kolchak government still unrecognized by the hesitant Allies. Meanwhile his campaign against the Red Army had taken an unfavorable turn. The crisis came in the months of May–June, when Kolchak's force, weakened by dissensions within and political differences without, was driven back in increasing disorder first to the Urals and then to Irkutsk. There, betrayed and surrendered to his Bolshevist enemies, he was executed on 7 Feb. 1920. Greater chaos followed this turn of affairs in Siberia, which were aggravated by the military occupation of the country by the victorious Bolshevists. Having already taken the towns of Omsk and Tomsk in 1919, the Red Army, then master of the Trans-Siberian Railway, occupied the whole of Kamchatka by the middle of January 1920. Soon the Russian Soviet established its authority over the entire area west of Lake Baikal. Ruthless measures gradually restored outward order and by 1921, when the long series of civil and foreign wars that followed in the wake of the Bolshevist revolution was over, practically all of Siberia had been subjugated by the Bolsheviki. After that, the history of Siberia became merged in that of Soviet Russia.

After the collapse of the All-Russian Siberian Government and the Allied efforts at intervention, the Bolshevists in Siberia proceeded to erect a "buffer state" between their newly-acquired Asiatic territory and Japan. They shrewdly transformed the Irkutsk West-Siberian Revolutionary Committee into a Far Eastern Republic, ostensibly independent but in reality controlled by the Soviet State. In 1920 this republic transferred the vast region of Kamchatka to the Soviet; in 1922 it became Soviet in earnest, under the title of "the Far Eastern Soviet Socialist Republic"; and in 1925 it ceased to exist altogether, absorbed in the Soviet Republic. The general principle underlying all territorial divisions and sub-divisions in Siberia, as indeed within the rest of Asiatic Russia, was apparently that of allowing the various "autonomous" groups as much nominal political independence as would satisfy their

Asiatic Members of the Union of Socialist Soviet Republics.

Name	Capital	Area square kilom.	Population
Transcaucasian S.S.R.	Tiflis	184,492	7,110,800
Turkomanistan S.S.R.	Askhabad	491,216	1,268,900
Uzbekian S.S.R.	Tashkent	195,246	5,417,800
Tajikian S.S.R.	Stalinabad	145,400	1,332,700
Kirghizia A.R.	Frunze	101,200	1,302,100
Kazak A.S.S.R.	Alma Ata	1,400,000	6,796,600
Yakutsk Republic	Yakutsk	3,769,000	327,500
Buriat-Mongol Republic	Ulan-Ude	419,000	620,900
Baskhir Republic	Ufa	100,800	2,889,800
Mordov	Saransk	21,000	1,414,600
Kabardian-Balkar	Naichik	12,000	278,800
Tatar	Kazan	61,000	2,784,800

respective desires for local self-government without placing any real political power into their hands. Thus every territorial unit within the Union, with but a single exception, fell under the economic and political control of the Russian Soviet, no matter how "autonomous" it was supposed to be.

Besides the political and territorial divisions already mentioned, Siberia—in the more general sense of Asiatic Russia—contains several of the various members of the Union of Soviet Socialist Republics. Of these the leading members are shown in the preceding table.

SIBERT, William Luther, American soldier and engineer: b. Gadsden, Ala., Oct. 12, 1860; d. near Bowling Green, Ky., Oct. 16, 1935. He graduated from the University of Alabama in 1880 and from the U. S. Military Academy in 1884. Assigned to the Engineers, he directed, in the years immediately following, several important government projects, including a ship canal between the Great Lakes. He was appointed a member of the Isthmian Canal Commission in 1907, and until 1914 was engaged on the Panama Canal, where he built the Gatun Locks and Dam, and excavated the channel from Gatun to the Atlantic Ocean. He received the thanks of Congress for his services.

Promoted major general in 1917, Sibert accompanied Gen. Pershing to France and took command of the First Division. In Jan. 1918 he returned home to command the South-Eastern Department at Charleston. He organized and directed the Chemical Warfare Service, 1918–1920, and retired in the latter year. From 1923 he was chairman and chief engineer of the Alabama State Docks Commission. He received the D. S. M. and the Legion of Honor.

SIBLEY, sĭb'lĭ, **Henry Hastings,** American soldier: b. Detroit, Mich., Feb. 20, 1811; d. Saint Paul, Minn., Feb. 18, 1891. He was chosen delegate to Congress from Wisconsin and Minnesota Territories in 1849, representing both in a similar capacity until 1853. He was elected the first governor of Minnesota 1858, and through his personal efforts he successfully brought the Sioux War to a close in 1863. The later years of his life were occupied with the general educational interests of his State.

SIBLEY, Hiram, American financier: b. North Adams, Mass., Feb. 6, 1807; d. Rochester, N. Y., July 12, 1888. In his early life he worked as shoemaker, and later as journeyman machinist in a cotton factory. In 1843 he established a banking business at Rochester and later was elected sheriff of Monroe County. He was interested in the early experiments in electric telegraph and aided in securing an appropriation from Congress to further the inventions of Samuel F. B. Morse. He combined with other capitalists, among whom was Ezra Cornell, and consolidated the small existing telegraph companies into the Western Union, which was chartered by the legislatures of New York and Wisconsin in 1856. He was elected president of the company and held the office for 10 years.

In 1861, Sibley began the construction of a transcontinental railway that was afterward incorporated with the Eastern systems, making a continuous line from the Atlantic to the Pacific. He projected a telegraphic line with Europe by way of Bering Strait and Siberia and to this end obtained valuable franchises from Russia, but the project was abandoned when the success of the submarine telegraph was assured.

After retiring from the telegraph business he engaged in railroading, mining operations and various other industries. He owned large tracts of improved land and was interested in a seed and nursery business at Rochester. He founded the Sibley College of Mechanical Arts at Cornell University and presented Sibley Hall to the University of Rochester.

SIBLEY, city, Iowa, seat of Osceola County, 75 miles north-northeast of Sioux City, on the Chicago, Rock Island, and Pacific, and the Chicago, St. Paul, Minneapolis, and Omaha railroads. It is an agricultural community with a large cooperative creamery and brick kilns. Pop. (1950) 2,559.

SIBONEY, sē-bō-nā', a village in Cuba, ten miles southeast of Santiago de Cuba near which the United States troops disembarked in the Spanish-American War. It was the scene of a sharp struggle between the American and Spanish forces June 23, 1898. Four troops of Rough Riders, under Colonels Leonard Wood and Theodore Roosevelt, were ambushed at this point and 16 Americans were killed. Notwithstanding their surprise and losses the Americans charged up the hill with such intrepidity that the Spaniards abandoned their block-house and fortified position, leaving 40 of their dead behind. The village was found to be infested with yellow fever, and in July was burned to the ground at the request of the medical officers.

SIBONGA, sē-bōng'ä, Philippines, municipality, province of Cebu, on the east coast, 28 miles southwest of Cebu, the provincial capital. It is on the coast highway, has a good anchorage, and is open to coastwise trade. Pop. (1948) 19,230.

SIBUTU, sē-vōō'tōō, an island of the Tawi Tawi group, Sulu Archipelago, Philippines, 30 miles southwest of the island of Tawi Tawi. It is 18 miles long, two miles wide and covers an area of 36 square miles. The surface is mostly flat, with a conical hill in the center rising to the height of 500 feet. It is heavily wooded, and the soil is fertile, but there is no agriculture. There is a transient population of Moro and Sulu fishermen and a small village on the southeast coast.

This island was found to be nine miles outside the western line of demarcation under the Paris treaty with Spain, and in 1900 was

by a supplementary convention (concluded Nov. 7; proclaimed May 23, 1901) included along with Cagayan Sulu Island in the Spanish possessions ceded to the United States. Spain received a grant of $100,000 for correction of the oversight. Pop. (1948) 3,947.

SIBUYAN, sē-vo͞o-yän′, island, Republic of the Philippines, in Romblon Province, in the Sibuyan Sea, between Luzon and Panay islands on the north and south, and Masbate and Tablas islands on the east and west; area 173 square miles. Its highest point is Mount Guitinguitin, 6,750 feet. Its chief products are rice and coconuts. Cajidiocan, on the eastern coast, is the chief municipality. Pop. (1948) 21,971.

SIBYL, sĭb′ĭl, in ancient mythology, a prophetess. Among the early Greeks and Romans such a prophetess was supposed to be inspired by a god, usually Apollo. She was often associated with some shrine or temple, as at Delphi, where the sibyl while in trance uttered her prophetic sayings in unintelligible riddles which were translated by attendant priests, who might also write out the prophecies in Greek hexameter verse. By the 4th century B.C., several such sibyls lived in various parts of the ancient world, the most widely known among them being the Babylonian (or Persian), Cimmerian, Cumaean, Delphian, Erythraean, Libyan, Phrygian, Samian, Tiburtine, and Trojan (or Hellespontine) sibyls. Of these, the most famous was the Cumaean Sibyl, who, according to legend, conducted Aeneas on his visit to the lower world, and sold Tarquin the Proud the Sibylline Books. She lived in a cave in the heart of Mount Cuma near Cumae, a Greek colony in southern Italy. The caves and the underground cavern where the sibyl pronounced her prophecies still exist. Speaking tubes cut through the rock and skillfully arranged sounding boards made it seem that the prophetic voice came from the center of the earth and spoke from every side, just as Virgil describes it in the *Aeneid*. See also SIBYLLINE BOOKS.

"Persian Sibyl" by Michelangelo.

SIBYLLINE BOOKS, sĭb′ĭ-līn, the three books (or rolls) of prophecies concerning Rome which the Sibyl of Cumae sold to Lucius Tarquinius Superbus (534–510 B.C.), called Tarquin the Proud, last of the legendary kings of early Rome. The legend is that the sibyl first offered nine books to Tarquin at a price so high that he refused to buy them. She then burned three of the books and offered the remaining six at the same price. Again Tarquin refused, whereupon the sibyl burned three more. Tarquin, fearing that she might destroy them all, bought the last three books at the price the sibyl had asked for the nine. The books were placed in the care of the Quindecimviri Sacris Faciundis, a commission of 15 members, who at the direction of the Senate, in times of public danger, consulted the prophecies to learn what religious measures should be taken to ward off the threatened calamities. For many years the books were kept in a stone chest in the temple of Jupiter Capitolinus, but were lost in the fire which destroyed the temple in 83 B.C. A new collection of sibylline verses was made and placed in the temple of the Palatine Apollo, and was apparently in existence until the year 400.

SIBYLLINE ORACLES. Between the 1st century B.C. and the 2d century A.D., a collection of spurious sibylline verses grew up, some fragments of ancient oracles, others largely the work of learned Jews of Alexandria. To some of these were added Christian interpolations making the supposed sayings of the sibyl contain prophecies concerning the Messiah. An illustration of the way these oracles linked the sibyl and Biblical personages is in the first stanza of the *Dies Irae: teste David cum Sibylla* (witness David with the Sibyl), which makes both David and the sibyl prophesy destruction of the earth by fire. There were about 15 books of these oracles; some 14 of them are still extant.

SICARD, sē-kär′, **Roche Ambroise Cucurron** (known as ABBÉ SICARD), French educator of deaf-mutes: b. Fousseret, near Toulouse, France, Sept. 20, 1742; d. Paris, May 10, 1822. After studying the methods of the Abbé l'Épée at the Paris Institution for Deaf-Mutes, Sicard became director of a similar school in Bordeaux. In 1789 he succeeded the Abbé l'Epée as director of the Paris school and made important improvements in the teaching methods. During the French Revolution he narrowly escaped with his life, and under the Directory avoided exile only by hiding. On the overthrow of the Directory, he resumed his work with the deaf and dumb, and in 1816 was made a member of the Académie Française. Besides other works, he wrote *Théorie des signes pour l'instruction des sourds-muets* (1808).

SICILIAN CAMPAIGN. See WORLD WAR II—*An Attack Upon Fortress Europe* (The Sicilian Campaign).

SICILIAN VESPERS, sĭ-sĭl′yăn vĕs′pĕrz, the revolt against French rule in Sicily which broke out at Palermo on Easter Monday, March 30, 1282, and quickly spread throughout the island. In revenge for the barbarous misrule of the French officials whom Charles I had left to govern Sicily when he moved his court from Palermo to Naples,

the populace massacred most of the French in Sicily. The ringing of the vesper bell was said to be the signal for the uprising to begin, hence the name. See also SICILIES, KINGDOM OF THE TWO.

SICILIES, Kingdom of the Two, a former political and sovereign state of Italy consisting of the southern portion of the Italian peninsula and the island of Sicily. After the fall of the Roman Empire in 476 A.D., southern Italy and Sicily were occupied by the Ostrogoths. By the middle of the 6th century (535), however, both Naples and Sicily came under the rule of the Greek emperors who administered the two regions through a governor appointed by the exarch of Ravenna. In the 9th century a violent rivalry arose between the exarchs and the Lombards which eventually resulted in the establishment of several independent duchies, among them Salerno, Capua, Taranto, and Benevento, the most powerful of them. At the same time, Naples, Amalfi, and Gaeta were governed as republics.

In 827 the Saracens took Sicily from the Greeks, holding it until 878. Meanwhile, they also invaded Calabria, Bari, and Taranto. The struggle between the Saracens and the Greeks for the possession of southern Italy continued until 967 when Emperor Otto I succeeded in placing Benevento under the German Empire. Around the year 1000 Palermo became the center of the new Arabic civilization. For the next 200 years Germans, Greeks, and Arabs were in constant warfare for the possession of southern Italy and Sicily. This rivalry encouraged the Normans to descend into Italy. Their occupation of Aversa, in the Province of Caserta, toward the middle of the 11th century, soon brought more Normans to Italy. In 1047 five of the sons of Tancrède de Hauteville, a count in Lower Normandy, descended into Italy with many followers. The boldest and most artful of the five was Robert Guiscard who trained the local peasants to become his best soldiers. Their support made it possible for Count Robert to hold Apulia which, in 1053, he had received as a papal fief. Seven years later he assumed the title of duke of Apulia and Calabria. Not long afterward, in 1072, his younger brother, Count Roger, conquered Sicily. The death in 1085 of Count Robert, who left no heirs, permitted Count Roger to combine in his person the whole power of the House of Hauteville as Roger I of Sicily. Meanwhile, his second son and successor, Roger II, succeeded in taking possession of all Lower Italy by subduing Capua, Amalfi, and Naples which, up to that time, had been prosperous commercial republics. Finally, in 1130, the antipope, Anacletus II, bestowed upon Roger II the title of king of Apulia, Calabria, and Sicily. This union of Naples and Sicily, which now became known as the Kingdom of the Two Sicilies, continued for 150 years. Each section, however, was permitted to retain its existing laws.

In 1198 Frederick (the son of Henry VI), under the guardianship of Pope Innocent III, was made king of Sicily as Frederick II. An enlightened ruler, Frederick established his capital in Palermo, where he introduced wise legislation, fostered the modern spirit, and developed literary and cultural activities. He attracted many learned men and poets who formed the Sicilian School of Poetry. For the first time the native language was used extensively in poetical compositions. Frederick also established the University of Naples and the School of Medicine of Salerno. In 1220 Pope Honorius III made him Holy Roman Emperor, as Frederick II.

The death of Frederick II in 1250 struck a serious blow to the empire, the Ghibelline party, and the cultural development of southern Italy and Sicily. Pope Clement IV, who had formed an alliance with the communes, conferred the investiture of the crown of Sicily on Charles I of Anjou (1226–1285), the brother of Louis IX, king of France. In the war which ensued, Manfred, son of Frederick II, was killed at the Battle of Benevento in 1266. Thereupon Charles I took possession of the kingdom. The power wielded by Charles I was great, but the Sicilians were not satisfied with the French feudal lords, especially after they transferred their capital from Palermo to Naples. The revolution of the Sicilian Vespers (1282 q.v.) ended the rule of the Anjous in Sicily. In the struggle, the Sicilians were aided by Peter III, king of Aragon (Spain), who had married a daughter of Manfred. By the Peace of Caltabellotta (1302), the unity of southern Italy was broken, for the Anjous retained possession of southern Italy, while the Aragons occupied Sicily.

For more than a century Naples and Sicily remained divided. They were united again in 1442, under Alfonso V of Aragon (r. 1416–1458), who ruled Sicily and Sardinia as Alfonso I. On his death, in 1458, his natural son, Ferdinand I, succeeded him only in the kingdom of Naples (r. 1458–1494). In 1494, Charles VIII, son and successor of Louis XI, invaded Italy, reached Naples (1495) without opposition, and occupied the kingdom of Naples as heir to the rights of the house of Anjou. The king of Aragon, Ferdinand II, after a show of resistance, withdrew to Ischia. A struggle between the French and a league consisting of the pope, the emperor, Ferdinand of Aragon, Venice, and Milan, ended in 1503 with the victory of the Spaniards in Naples. In 1504 Sicily was again united to Naples under the Spanish crown, and governed by viceroys.

The Peace of Utrecht in 1713 again divided the Two Sicilies, Naples falling to Charles VI of Austria, and Sicily to Victor Amadeus II of Savoy. King Philip V of Spain reconquered Sicily in 1718, at the instigation of Cardinal Giulio Alberoni, but he was forced to cede it to Austria in 1720, Savoy receiving Sardinia in exchange. In this manner the Two Sicilies became a part of the Austrian dominions.

In 1734 the Spanish infante, Don Carlos, son of Philip V, at the head of an army invaded Naples, conquered both the continental and the insular parts of the kingdom, and became king as Charles IV (later Charles III of Spain, q.v.). When the wars of the Austrian succession ended in 1748, with the Peace of Aachen, Italy was able to enjoy a half century of peace, during which the Bourbons in Naples governed the region with wisdom and tolerance.

In 1759, when Charles IV ascended the Spanish throne as Charles III, he conferred the kingdom of the Two Sicilies on his son Ferdinand IV of Naples, and decreed at the same time that it should never again be united to the Spanish monarchy. The reign of Ferdinand IV extended through the stormy period of the French Revolution and the subsequent European commotions. On March 30, 1806, Napoleon appointed his brother Joseph king of Naples. On July 15, 1808, Joseph was replaced by Joachim Murat who assumed the title of Joachim I, king of Naples, while Ferdinand IV was relegated to Sicily. The Congress of Vienna which convened in 1815 restored the Bourbons to the Two Sicilies. Ferdinand IV now assumed the title of

Ferdinand I and reigned until 1825. (His successors, Francis I, r. 1825–1830; Ferdinand II, called Bomba, r. 1830–1859; and Francis II, r. 1859–1861, were despotic tyrants who forced the people into periodic revolts which were put down with much severity.) In 1821 Ferdinand I was forced by Austria to crush the rebels and annul the constitution which he had granted the previous year. Another revolution in 1848 seriously threatened the Bourbon dynasty but it was quickly suppressed.

In May 1860, however, an insurrection broke out in Sicily, and an expedition of 1,000 volunteers from Piedmont and other provinces, under the leadership of Giuseppe Garibaldi, sailed from Genoa to the assistance of the insurgents. This small army, swelling in numbers as it progressed, advanced through the entire island, gaining victories at Calatafimi and Milazzo and driving the Neapolitan troops from the island. Following up his success, Garibaldi crossed to the mainland, where he met little or no opposition. Francis II fled from Naples and the strong places in his hands were reduced. By a popular vote, the Kingdom of the Two Sicilies ceased to exist as such and became an integral part of the kingdom of Italy, which was proclaimed by the Italian Parliament on March 17, 1861. For bibliography, see SICILY. See also NAPLES, KINGDOM OF.

HOWARD R. MARRARO,
Professor of Italian, Columbia University.

SICILY, sĭs'ĭ-lĭ (Ital. SICILIA), largest and most populous island in the Mediterranean Sea, forming with some small neighboring islands, chiefly Pantelleria, Ustica, and Lipari and Egadi islands, an autonomous region of Italy. The island lies off the southwestern tip of the Italian peninsula, from which it is separated by the Strait of Messina which at its narrowest point is about two miles wide. The island's roughly triangular shape gave it in ancient times the name Trinacria or Triquetra, the vertices of which are the three principal capes: northeast, Cape Faro (Peloro); southeast, Cape Passero (Pachino); northwest, Cape Boeo (Lilibeo).

Geography.—Sicily lies almost in the center of the Mediterranean, approximately 80 miles from Cape Bon, in northeast Tunisia. Except for the plain of Catania in the east and the Conca d'Oro near Palermo, the coast is steep and cliffs and hills abound. The surface is generally mountainous, for the most part rising more than 500 feet above sea level. The principal mountain ranges, which in their geological formation are the continuation of the Calabrian Apennines, are the Peloritani (Mount Grande, 4,562 feet); the Nebrodi (Mount Moro, 4,758 feet), Mount Sori (6,129 feet); Le Madonie (the Pizzo Antenna, 6,557 feet), and Rocca Busambra (5,362 feet). In the western central part there is a high plateau which culminates in Mount Cammarata (5,239 feet). A depression through which flow the rivers Torto and Platani separates west Sicily from the east, on a line which extends from Termini Imerese, on the Tyrrhenian Sea, to Porto Empedocle, on the Sicilian channel. To the east of this depression is the sulphur plateau, with the Erei and Iblei mountains. On the east coast is Mount Etna, 10,884 feet, the largest volcano in Italy. The tracts of plains include the beautiful plateaus of Conca d'Oro, near Palermo, dominated by Mount Pellegrino (2,012 feet), and the Plain of Catania, famous for their fertility and mild climate.

There are many rivers, but except during the rainy seasons of autumn and winter, most of them are dry. The largest river is the Salso (89 miles). This river and the Platani (68 miles) and the Belice (47 miles) empty into the African Sea. The Simeto (72 miles) empties into the Gulf of Catania after receiving the waters from the Dittaino and the Gorna lunga. The important gulfs are Palermo, Castellammare, Patti, Catania, Augusta, Noto, and Gela. The principal ports are Palermo, Messina, Catania, Syracuse (Siracusa), Marsala, and Trapani.

Sicily is surrounded by islands which come within its jurisdiction. The Lipari Islands, northwest of Messina, besides the active volcano Stromboli, include the small islands of Lipari, Salina, Filicudi, Alicudi, Vulcano, and Panaria. The Pelagie (Pelagian Islands) comprise the islands of Lampedusa, Lampione, and Linosa. Ustica Island is north of Palermo. The Egadi group is west of Trapani. Pantelleria is in the Mediterranean, about 65 miles southwest of the Sicilian coast.

Climate.—The climate of Sicily is mild even during the winter months. Frost and snow are rare on low grounds and along the coast. The top of Etna, however, is covered with snow even in July. The excessive heat of the summer is tempered by gentle, cool breezes. The mean temperature in Palermo is 13°C. in winter; 16.4°C. in spring; 21.1°C. in summer; and 20.3°C. in autumn. The summer months are fairly dry and rainfall is scarce.

Area and Population.—With an area of 9,815 square miles (exclusive of the neighboring small islands), Sicily ranks first among the Italian regions. On Jan. 1, 1954, the estimated population was 4,571,147, equivalent to 466 inhabitants per square mile. In the 1951 census it had a population of 4,462,220 inhabitants, an increase of 894,100 persons, or 20 per cent, since the 1901 census. The increase occurred despite the fact that more than 160,000 Sicilians are residing in other regions of Italy, and several hundred thousand others have migrated to European and oversea countries. In 1906, 127,000 Sicilians (3.5 per cent of the population) emigrated. Since the end of World War I, however, emigration has fallen off considerably.

The population of Sicily is growing at a faster rate than that of the rest of the country. Per thousand population, in 1953, the birth rate was 21.7; the death rate 9.5; and the excess of births over deaths was 12.2. During the same year Italy, as a whole, had a birth rate of 17.4; a death rate of 9.8; and an excess of births over deaths of 7.6.

The 1954 population of the nine provinces into which the island is divided are represented in the following table:

Province	No. of Communes	Population 1954 (Residente)
Agrigento	42	471,903
Caltanissetta	22	298,496
Catania	53	800,051
Enna	20	242,675
Messina	103	667,963
Palermo	77	1,021,701
Ragusa	12	239,337
Siracusa	19	323,012
Trapani	23	421,611
Total, Sicily	370	4,486,749

There are only a few large cities. Only three—Palermo, Catania, and Messina—have a population of 100,000 or more. Four others range from 50,000 to 100,000 population.

Palermo (501,005 inhabitants), the capital of the island, is the largest city. Combining modern and ancient characteristics, it has monuments belonging to three distinct periods (Arab-Norman, Renaissance, and Baroque) of which the most noteworthy are the cathedral and the Church of the Martorana, both of which date back to 1132; the royal palace with the Palatine Chapel; San Giovanni degli Eremiti and the Palazzo La Zisa. Beautiful villas and fountains enrich the city, which is also important for its position and commerce. Near Palermo is Monreale with its imposing Norman cathedral.

Catania (300,298 inhabitants), at the foot of Mount Etna, was destroyed by an eruption of 1669 and an earthquake of 1693. Rebuilt during the 18th century, the city is enriched with fine architecture of that period and with monuments which have escaped destruction, for example, the Duomo, Castello Urbino, and the Elephant Fountain.

Messina (220,790 inhabitants), founded by the Greeks and built on the strait of the same name, was destroyed together with Reggio Calabria by the earthquake of 1908. It has since been rebuilt along modern lines, although it has lost its commercial importance. South of Messina is Taormina, whose natural beauty, climate, and Graeco-Roman ruins make it a mecca for tourists.

Agrigento (40,557 inhabitants) is famous for its Doric monuments of the Valle dei Templi which are equaled only in Greece. Trapani (71,798 inhabitants), ancient Phoenician colony, has a good port for the local industries, salt-making, tuna fisheries, and wine making. Syracuse (71,212 inhabitants) is well known for its port and Greek theater and amphitheater, a museum which houses the Anadyomene Venus, and its ancient latomie (stone quarries used as prisons). Ragusa (48,391 inhabitants) lies inland in the southeastern part of the island and is noted for its asphalt mines and oil, and for a magnificent baroque church (Basilica of St. George). Caltanissetta (60,303 inhabitants) and Enna (27,154 inhabitants) are located in the eastern part of the island.

The Sicilians are a hard working, passionate people who have given many famous poets, musicians, painters and writers to the world, including Stesichorus, Theocritus, Empedocles, Archimedes, Alessandro Scarlatti, Giovanni Meli, Giovanni Pacini, Vincenzo Bellini, Michele Amari, Filippo Juvara, Francesco Crispi, Giovanni Battista Basile, Giovanni Verga, Mario Rapisardi, Luigi Pirandello, and Giovanni Gentile.

Organized brigandage and the Mafia have disappeared.

Government.—The Constitutional Law No. 2 of Feb. 26, 1948, provided for the regional autonomy of the island with its own juridical system within the political unity of the state. The Regional Assembly, consisting of 90 members, is elected every four years by universal, secret, and direct suffrage. The executive and administrative branches of the government are vested in the president, who is elected by majority vote of the Regional Assembly, and in a board of assessors. The Regional Assembly is concerned with problems related to agriculture, drainage, industry, commerce, public works, mining, fisheries, public welfare, education, museums, libraries, academies, public health and hygiene, communications, credit and banking, social and labor legislation.

Education.—In 1860 almost 90 per cent of the population was illiterate; by 1931, 40 per cent of the population six years of age or over could not read or write. Educational facilities greatly improved, however, after the end of World War II. In 1952–1953 there were 419,500 pupils in elementary schools; there were 16,798 teachers; and 2,850 schools. Registration in the junior and senior high schools has increased greatly. There are three universities—Palermo, Catania, and Messina—with a total enrollment (1952–1953) of 18,076.

Agriculture.—Sicily is essentially an agricultural region, though cattle raising is not prosperous. Wide pockets of fertile valley land are found along the coasts, notably around Palermo and Catania, which are cultivated as vineyards, or as olive, orange, and lemon groves. Despite the constant danger of droughts, Sicily produces 10 per cent of Italy's wheat, one third of her rye, one eighth of her olive oil, and one twelfth of her wine. In Roman days, the richness of her soil made the island the granary of Italy. Other important products are the locust or carob bean (used for forage), corn, mulberry leaf, chestnuts, almonds, pistachio nuts, hazelnuts, and prickly pear. Large quantities of almonds and citrus fruits are exported to European and overseas countries. Vegetables are cultivated especially in the vicinity of large cities.

Industry.—The most important industries are those making food products, such as tomato sauce and paste, and spaghetti. Deep-sea fisheries, tuna and sardine fishing, and citric acid production, are also important, especially in the vicinity of Marsala and Palermo. The mechanical and chemical industries are centered around Palermo. The making of Marsala wine constitutes a flourishing industry.

Sicily is rich in sulphur mines which are located in the provinces of Caltanissetta, Enna, and Agrigento. Before World War I, Sicily was the largest producer of sulphur in the world; it has now to compete with American sulphur. Other important mineral deposits include asphalt, common salt, and rock salt. Oil has been discovered near Ragusa in the southeastern corner of the island. Experimental drilling for oil is also proceeding intensively in Agrigento Province where some 519,000 hectares of land are being drilled (1 hectare = 2.471 acres). In an effort to improve the industrial development of the island, there has recently been created the Istituto per il Finanziamento alle Industrie in Sicily (IRFIS) —Institute for the Financing of Industry in Sicily—which has already appropriated more than 4,028,000,000 lire ($1 = about 624 lire).

Economy.—Trade and production in Sicily have long lagged behind the central and northern regions of Italy. However, although there is still much poverty, economic conditions have steadily improved since the end of World War II, when the regional government initiated its program for the expropriation of large estates for the benefit of the peasant class. In addition, the regional government has undertaken many public works and social improvements either with its own funds, in conjunction with other state

agencies, or with the contribution of the Southern Italy Fund. Up to Dec. 31, 1954, a total of 16 billion lire had been allocated for road construction and repair. A total of 75,237 miles of new roads were built, and 616,365 miles of roads were repaired. The national government has appropriated more than 1,280 billion lire for the Southern Italy Fund, of which 251,140 million lire have been earmarked for Sicily. Exclusive of appropriations made through the Southern Italy Fund and the National Solidarity Fund, the national government to January 1955, had appropriated a total of 3,613 billion lire for agriculture, industry, housing, roads, hygiene, public health, schools, and other improvements.

These public works projects have served to improve the economic conditions of the island. Only 266,000 persons, or 6.1 per cent of the working population, were unemployed in 1953. A total of 4,117,000 were employed. In the whole of Italy, during the same year, 6.6 per cent of the working population was unemployed.

Communications.—Before it became a part of the kingdom of Italy in 1860, Sicily had no railway lines. Now, however, a network of main and secondary lines unite the principal cities and towns. The mountainous character of the island has made the construction of railroads and automobile roads very costly. Communications by water are well developed. Steamers ply daily between Naples and Palermo and between Naples and Messina and Catania. Several navigation companies touch the ports of Sicily. Communication with the mainland is in general by ferryboats which ply between Messina and Villa San Giovanni and Reggio Calabria but construction of a dual suspension bridge across the Strait of Messina is under study.

History.—The history of Sicily goes back to several thousand years before Christ. In 1952 in a cave near Palermo, Stone Age drawings were discovered which are placed roughly at 15,000 B.C. Among them are the oldest drawings of human figures ever found. The legendary Cyclops of Homer's *Odyssey* lived on the island. The first people of historical record here were the Sicans (Sicani) who inhabited the island 11 centuries before Christ. The Sicans were driven out by the Sicels (Siculi) who gave the island its name, occupying most of the land east of the river Gela. However, there is no substantial difference between the Sicans and the Sicels, and it is probable that both are branches of the Libyco-Iberian stock. Sicily was already a part of the Mycenaean civilization of Crete before the arrival of the Phoenicians. Because of its geographical position and the fertility of its soil, the island attracted many navigators, including the Phoenicians who established important trading settlements along the coast or on summits along the coast. But the Greeks about 724 B.C. founded Messina, which they called Zancle (Greek for sickle) from the shape of its harbor. Even earlier, some Corinthian Greeks had built Syracuse farther south on the eastern coast. Moving westward, in 691 B.C., they also settled Gela on the southwestern coast of the island. By 635 B.C. the Greeks had driven the Phoenicians back to Motya, Solus, and Panormus (Palermo) in the western part of the island, and meanwhile had set foot on the southern portion of the peninsula, calling the united lands by the name of Magna Graecia.

Under the Greeks, Sicily became highly civilized and prosperous and attained high intellectual progress. The political constitutions were aristocratic, but civil discords gave Phalaris and other tyrants the opportunity to rise to power. By the 5th century B.C. Syracuse was the most important and the strongest of all Greek cities. The Greek temples and monuments of Syracuse, Catania, Messina, Agrigento, Selinunte (Selinus), and Taormina are, after the Parthenon, the most impressive Greek remains in existence. At its greatest Syracuse had a population of a million.

The wealth and resources of Syracuse could not fail to invite conquest. For years it fought off raids by other Sicilian Greeks, especially by the Athenians and the Carthaginians. As a result of Athenian expansion (415–413 B.C.) in Sicily, the island was brought more fully into Greek affairs. Moving westward on the island, the Greeks tried unsuccessfully to found other colonies, for the Carthaginians had already established themselves there. The Phoenicians in Sicily became dependent on Carthage, whose power was a source of constant threats to the Greeks in Sicily. Beginning with the 6th century B.C., a series of tyrannies overtook the island, but fortunately were not long lived. A period of a half century of prosperity followed, during which art, science, poetry, philosophy, and architecture flourished.

Unable to extend their possessions in Sicily, the Greeks began to settle along the Italian mainland, founding Sybaris, Croton, Tarentum, and other cities. Meanwhile, the original inhabitants—the Sicans and the Sicels, the Calabrians, and the Sallentini—at first struggled against the invaders, but in time were assimilated by them. However, no strong bonds united these peoples and internal disorders occurred frequently. With the fall of Athens, Greek domination of Sicily came to an end.

The Carthaginians, Phoenician in origin, who had previously attempted to conquer Palermo, returning to Sicily, reduced the city to a pile of debris. They occupied a large part of the island including Acragas (Agrigentum), Selinunte (Selinus), and Panormus (Palermo). Greeks and Carthaginians, victorious and conquered in turn, fought obstinately for possession of the island.

Encouraged by the strife between the Greeks and the Carthaginians, the Romans moved southward to the Strait of Messina, clashing with the might of Carthage. In this period, the Roman Republic lived some very critical moments, especially during the Second Punic War, when Hannibal led his army into Italy and defeated the Romans more than once. But he was not successful in inducing the Italian cities to rise against Rome, and was finally defeated at Zama in North Africa, in 202 B.C., by the Roman general, Scipio Africanus. During the Third Punic War, another Roman general, Scipio Aemilianus, in 146 B.C., destroyed Carthage. Under the Romans, Sicily became the granary of the empire. For a continuation of the history of Sicily, see SICILIES, KINGDOM OF THE TWO.

HOWARD R. MARRARO,
Professor of Italian, Columbia University.

SICK MAN OF EUROPE, The (or OF THE EAST), a term applied to Turkey in 1854 by Czar Nicholas I of Russia in a conversation with Sir Hamilton Seymour, the British ambassador at St. Petersburg. Intimating that in his opinion Turkey was sick and dying, the czar proposed that Russia and Great Britain should come to a private arrangement as to disposal of the Sick Man's possessions. The British government rejected the proposal and intimated belief in the Sick Man's recovery. The term is no longer applied to Turkey.

SICKERT, sĭk'ĕrt, **Walter Richard,** English painter and etcher: b. Munich, Germany, May 31, 1860; d. Bathampton, England, Jan. 23, 1942. He studied art under Alphonse Legros at the Slade School, London, later became a pupil of James Abbott McNeill Whistler, and in the early 1880s studied in Paris with Edgar Degas. Sickert's studio was the center for the Camden Town group of artists, which later became the London group. An associate of the Royal Academy from 1924, he became a member in 1934, but resigned in 1935. The British Museum, Tate Gallery, Luxembourg, and other important galleries have examples of his work.

SICKINGEN, zĭk'ĭng-ĕn, **Franz von,** German knight and Protestant military leader: b. Ebernburg, near Kreuznach, Germany, March 2, 1481; d. Castle Landstuhl, near Kaiserslautern, May 7, 1523. Though the owner of large estates, he chose a military career and helped in the election of Charles V as emperor, becoming imperial chamberlain and councilor. He favored the Reformation and befriended many of its adherents. In 1522–1523 he headed a league to extend the Reformation throughout Germany and to securalize the land of ecclesiastical princes. He was defeated by a coalition of the archbishop of Trier, the landgrave of Hesse, and the count palatine of the Rhine, whose forces besieged him in his fortress castle of Landstuhl, where he died of wounds received in battle.

SICKLES, sĭk"lz, **Daniel Edgar,** American soldier: b. New York, N. Y., Oct. 20, 1825; d. there, May 3, 1914. He attended the University of the City of New York, but left before graduating to enter the printing trade, then studied law, and in 1846 was admitted to the bar. He was elected to the state legislature as a Democrat in 1847, and in 1853 became corporation counsel for New York. Through his efforts in 1852 Central Park was obtained for the city. In 1855 he was elected to the state Senate, and two years later became a member of Congress, serving until 1861. He was tried for the murder of Philip Barton Key, whom he shot on the street in Washington, D.C., on Feb. 27, 1859, because of Key's liaison with his wife, and was acquitted on the grounds of temporary aberration of mind. This was the first case in which that defense was set up. Key was United States attorney for the District of Columbia and son of the author of *The Star-Spangled Banner.*

At the beginning of the Civil War, Sickles raised in New York the Excelsior Brigade of volunteers, was commissioned colonel, became brigadier general the following September, and participated in the Peninsular campaign. As major general of volunteers, he was given command of the 3d Corps in February 1863, and fought at Chancellorsville and Gettysburg. At Chancellorsville he gained the first success of the day by cutting off the enemy's ammunition train and rallying the retreating Union artillery. At Gettysburg his corps withstood the Confederate assault on the famous peach orchard salient, and Sickles lost a leg in the encounter. He continued in active service until 1865, when he was sent on a confidential government mission to South America. Upon his return that year, he was appointed military governor of the Carolinas, but in 1867 was relieved of his command by President Andrew Johnson because of the severity of his measures. Mustered out of the volunteer army in 1868, he became a colonel in the regular army, and in 1869 was retired with the rank of major general. In 1869–1873 he served as United States minister to Spain. After serving another term in Congress from 1893–1895, he lived in New York City.

SICYON, sĭsh'ĭ-ŏn; sĭs'ĭ-ŏn (mod. Gr. SIKIÓN), ancient city, Greece, in Corinthia Department, about 10 miles northwest of Corinth and two miles from the Gulf of Corinth. The modern village of Vasilikón occupies the site. Founded from Argos and under its domination for several centuries, Sicyon gained its independence about 660 B.C., and for more than a century was ruled by tyrants, reaching its greatest power under Cleisthenes. It was an ally of Sparta in the Peloponnesian War (431–404 B.C.). In 251 B.C., it became a democracy under the leadership of its chief citizen, Aratus, and joined the Achaean League. From the 6th to the 3d century B.C., the city was a center of art and philosophy, and was famous for the beauty of its bronzes. The painters Apelles and Pamphilus and the sculptors Canacnus and Lysippus flourished there. The American School at Athens has excavated several of the ancient structures, including the theater and stadium.

SIDDHARTHA. See BUDDHA AND BUDDHISM; INDIA—*Buddhism.*

SIDDONS, sĭd"nz, **Sarah Kemble,** English tragic actress: b. Brecon, Wales, July 5, 1755; d. London, England, June 8, 1831. The eldest daughter of Roger Kemble, manager of a traveling theatrical company, she began her stage career in early childhood, and at 18 married the actor William Siddons. In 1775 David Garrick engaged her for his company at the Drury Lane Theatre, and from December until the following May she appeared there in various parts, including Portia in *The Merchant of Venice,* but without success. She returned to the provincial theaters, and soon began to display the dramatic power for which she became famous. After a phenomenal 5-year run at Bath, she was again engaged for the Drury Lane, and on Oct. 10, 1782 made her reappearance there as Isabella in Garrick's adaptation of Thomas Southerne's tragedy *The Fatal Marriage,* scoring an immediate success. She

was universally acknowledged to be the first tragic actress of the English stage. She subsequently visited Dublin and Edinburgh receiving equal applause. She appeared as Lady Macbeth for the first time in London on Feb. 2, 1785, and in that character was declared perfect by competent critics.

Christopher North, William Hazlitt, Leigh Hunt, Lord Erskine, and many others agreed in praise of her performances, which were at their best in tragedy, and belonged to the fine old declamatory (sometimes called the Kemble) school. In solemn majesty, pathos and minute finish she surpassed Mlle Rachel.

For 30 years she continued to astonish and enchant the lovers of the drama, and having acquired an ample fortune, and been portrayed by Sir Joshua Reynolds as the *Tragic Muse,* she took her leave of the stage in 1812, before an audience which melted into tears on the occasion. She, however, performed subsequently at benefits and gave privately Shakespearian readings.

She was seen as Rosalind, Ophelia, and Desdemona with great success; and, as Catharine in Henry VIII, discovered a part nearly as well suited to her as that of Lady Macbeth.

Consult Campbell, Thomas, *Life of Mrs. Siddons,* 2 vols. (London 1834); Fitzgerald, P. H., *The Kembles,* 3 vols. (London 1871); Kemble, Frances Ann, *Records of a Girlhood,* 3 vols. (London 1878); Maurois, A., *Portrait d'une actrice* (Paris 1927).

SIDEREAL CLOCK, sī-dēr'ē-ăl klŏk, a clock regulated to measure sidereal time, reckoned by sidereal days of 23 hours, 56 minutes, 4 seconds mean solar time, which are measured by the interval between two successive passages of any fixed star over the same meridian, and divided into 24 sidereal hours.

SIDEREAL TIME, for all practical purposes measured by the apparent diurnal motion of the stars, due to the Earth's axial rotation. A sidereal day is hence the time from the upper meridian passage of a star until its next passage. Rigorously, it is from one such passage to the next of the vernal equinox point, the day by this being shorter by 1/120 of a second than that determined by stars. Except in exact observations no allowance for this need be made and stars are always used in any case. Stars are so very distant that their motions are quite inappreciable in a day and effects upon the Earth's axial rotation due to its orbital motion are insensible. The sidereal day, due to tidal friction, is growing longer slowly, at about $\frac{1}{1,000}$ of a second per century. Its present length is 23 hours 56 minutes 4.091 seconds of mean time. A sidereal year is the exact period of the revolution of the Earth around the Sun or 365.25636042 mean solar days. The tropical year (our calendar year) contains 366.24 sidereal days, or one more than the number of solar days.

CHARLES P. OLIVIER.

SIDERITE, sĭd'ĕr-īt, a mineral composed of carbonate of iron, and when pure crystallizing in the rhombohedral system. It then is also known as spathic iron. Another name is chalybite. The faces of the rhombohedral crystals are commonly curved, and there is a perfect rhombohedral cleavage. Besides this it occurs in botryoidal and in globular form, with a more or less fibrous internal structure. Again it is massive, or coarsely or finely granular.

The hardness is 3.5 to 4; the specific gravity 3.7 to 3.9. It has a vitreous luster, and is often more or less pearly. The color varies from ash-gray, through yellowish-gray, greenish-gray, to brown and brownish-red; sometimes it is white. The streak is white. It is commonly translucent or subtranslucent.

In composition it is: $FeCO_3$. Part of the iron is usually replaced by manganese, and often by magnesium or calcium.

In the United States siderite occurs at Plymouth, Vt.; Sterling, Mass.; Roxbury, Conn.; Antwerp, Jefferson County, N. Y., and at the Rossie Iron Mines, Saint Lawrence County, N. Y., and in North Carolina. Also in Pennsylvania, Ohio and other states, chiefly as clay iron stones in the coal measures.

SIDEWINDER, sīd'wīn-dĕr, a local name in Arizona for the horned rattlesnake (*Crotalus cerastes*), referring to its sidewise method of progression. See also RATTLESNAKE.

SIDI-BEL-ABBES, sē'dĭ-bĕl-ă-bĕs', commune, Algeria, in the Department of Oran, 40 miles south of the town of Oran, on the Mekerra River. It is a modern walled town, and occupies a height rising from a fertile healthy and populous plain. Numerous fountains adorn the town. It is a leading commercial and trading center for the surrounding agricultural area. There is also trade in wine, olives, and livestock. Manufactures include cement, furniture, cheese, and hosiery. Once a walled town, the city now has a very modern appearance. Pop. (1948) 52,881.

SIDIS, sī'dĭs, **Boris,** Russian-American psychologist: b. Kiev, Russia, Oct. 12, 1867; d. Portsmouth, N. H., Oct. 24, 1923. He came to the United States in 1887, was graduated at Harvard University in 1894 and later pursued postgraduate studies there, taking his Ph.D. in 1897, his M.D. in 1908. He was associate in psychology and psychopathology at the Pathological Institute of New York State hospitals in 1896–1901; in 1901–1904 was director of the psychopathological hospital and laboratory of the New York Infirmary for Women and Children; and subsequently practiced medicine at Boston and at Brookline, Mass. He was also medical director of the Sidis Psychotherapeutic Institute at Portsmouth, N. H. His works include: *An Experimental Study of Sleep* (1909); *Philistine and Genius* (1911); *The Psychology of Laughter* (1913); *The Foundations of Normal and Abnormal Psychology* (1914); *Causation and Treatment of Psychopathic Diseases* (1916), etc.

SIDNEY, sĭd'nĭ, **Algernon,** English statesman and republican, son of the 2d earl of Leicester: b. Penshurst, Kent, 1622; d. London, Eng., Dec. 7, 1682. He was educated under the supervision of his father, whom he accompanied on his embassies to Denmark and to France. He served in 1642 as captain of a troop of horse in Ireland, and in the civil war espoused the cause of Parliament. He was promoted colonel of horse in 1645, was returned to the Long Parliament in 1646 as member for Cardiff, and in 1647 was appointed lieutenant general of the horse in Ireland and governor of Dublin, but was soon superseded and in 1648–1650 was governor of Dover. In 1649 he was appointed one of the commissioners for the trial of Charles I,

but while he attended three of the preliminary meetings he was not present at the trial and did not sign the warrant. He is frequently quoted as approving the measure, and later admitted his justification of it, but his plan, though not exactly clear, seems to have been the deposition of the king by an agreement of both houses. He incurred the enmity of Cromwell by his opposition, and during the first three years of the Commonwealth he stood aloof. In 1652, however, he was elected a member of the council of state and attended 82 meetings in the four and a half months before the council was dissolved by Cromwell, being particularly occupied with foreign affairs. He protested against the Protectorate of Cromwell and afterward held aloof from public affairs until the restoration of the Long Parliament by the army in 1659, when he resumed his place and was again appointed to the council of state. In that year he was sent as a commissioner to negotiate a peace between Sweden and Denmark, and while engaged in this mission the Restoration took place. Aware that his part in the civil troubles could but bring him into disfavor with the royal party, he remained in exile until 1677, when he was given leave to return to settle his private affairs. The excitement attending the exclusion struggle drew Sidney again into politics and he made several unsuccessful attempts to enter Parliament, although outside of that body he wielded a considerable influence. He vindicated himself from an accusation of being the head of a great non-conformist plot soon after the discovery of the "popish plot," but his private letters, though written with great caution, show a deep sympathy for the nonconformists and the Scots as well as an invincible hatred for bishops and Roman Catholics. He was engaged in an intrigue with the French Ambassador through whom he endeavored to persuade Louis XIV to aid the establishment of a republic in England and evidently hoped to gain at least the maintenance of the rights of Parliament. He undoubtedly received pecuniary aid to the extent of 1,000 guineas through the French Ambassador, though he evidently used the money for public purposes. He seems to have taken no part in the armed resistance of Shaftesbury in 1682, but in 1683 he formed one of the "council of six" in the "Ryehouse Plot" to organize an insurrection among the Scottish malcontents. He was arrested after its discovery and sent to the Tower, charged with three overt acts of treason, consisting of consultations amounting to a conspiracy to levy war against the king; invitation to certain Scots to co-operate with his plans; and of having written a treasonable libel concerning the lawfulness of deposing kings. The only witness against him on the first charge was the infamous Lord Howard, the second charge was proven unfounded, and regarding the third though his authorship of the incriminating paper was undoubted, yet there was nothing to show that it was intended for publication. The law demanded two witnesses for high treason. The notorious Judge Jeffreys accepted the paper as the second witness required by the law, and on this faulty evidence Sidney was sentenced to death. After a fruitless petition to the king he was executed on Tower Hill. His 'Discourses on Government' exhibit great acuteness, are forcibly written, and contain valuable historical information. They were first printed in 1698, and have been reprinted in 1740, 1751 and 1772. Consult Ewald, A. C., 'Life and Times of Algernon Sidney' (1873); Meadley, G. W., 'Memoirs of Algernon Sidney' (1813); Van Santvoord, G. V., 'Life of Algernon Sidney' (New York 1851); 'Dictionary of National Biography' (London 1888).

SIDNEY, Sir **Philip,** English soldier, statesman and poet: b. Penshurst, Kent, 30 Nov. 1554; d. Arnhem, Netherlands, 17 Oct. 1586. After studying at Oxford and Cambridge he set off on his travels at 18, visited France, Hungary and Italy. Returning through Germany and Flanders, he arrived in England in 1575. He became a favorite with Queen Elizabeth, who in 1576 sent him on an embassy to Germany. He had a quarrel with the Earl of Oxford, but the queen interposed to prevent a duel from taking place. Sidney, displeased at the issue of the affair, then retired to Wilton in Wiltshire, 1580, and amused himself with the composition of his celebrated pastoral romance, 'Arcadia.' He married Frances, daughter of Sir Francis Walsingham, in 1583. That same year he was knighted. About this time he projected with Sir Francis Drake an expedition against the Spaniards in America, and he had gone to Plymouth to embark on the undertaking, when an express mandate from Elizabeth recalled him to court. Her influence also was exerted to prevent him from being elected king of Poland, "refusing," as Camden says, "to further his advancement out of fear that she should lose the jewel of her times." He was subsequently appointed governor of Flushing, and general of the cavalry under his uncle Dudley, Earl of Leicester, who commanded the forces sent to assist the Dutch against the Spaniards. On 22 Sept. 1586, being at the head of a detachment of the English troops, he fell in with a convoy of the enemy marching toward Zutphen. In the rash charge of 500 against 3,000, Sidney received a shot in his thigh, which shattered the bone. An incident that occurred as he was being borne off the field illustrates his character. It is thus recorded by Lord Brooke (Fulke Greville) his biographer: "In which sad progress, passing along by the rest of the army where his uncle the general was, and being thirsty with excess of bleeding, he called for some drink, which was presently brought him; but as he was putting the bottle to his mouth he saw a poor soldier carried along, who had eaten his last at the same feast, ghastly casting up his eyes at the bottle. Which Sir Philip perceiving, took it from his head before he drank, and delivered it to the poor man with these words: "Thy necessity is greater than mine." His body was carried to England, and after lying several days in state was buried in Old Saint Paul's Cathedral. His brief career, which to many may seem not to justify his great reputation, nevertheless made a powerful impression on English patriotism. So universally was he esteemed that a general mourning for him was observed throughout the whole country. For a month no gentleman of quality cared to appear in London without mourning garb. He was panegyrized by his contemporaries, and the universities issued three volumes of elegies on

his death. "He adorned the paths of love, war, patriotism, religion, all that led through the wide fields of his beautiful, practical chivalry, with the roses and lilies of fragrant, flowery verse." Edmund Gosse. His works, besides the *Arcadia,* consist of the *Apologie for Poetrie,* later changed to *Defense of Poesie; Astrophel and Stella;* a collection entitled *Songs and Sonnets, and other poetical pieces.* None of these was published in his lifetime, his great contemporary fame being based on the reports of those to whom his manuscripts were communicated. He is best known for his *Arcadia,* one of the earliest specimens of the heroic romance, written in mingled prose and verse, the latter exhibiting various attempts to naturalize the measures of Roman poetry, and for the *Astrophel and Stella* cycle of 108 sonnets and 11 songs.

Bibliography.—Lee, Sir Sidney, *Sir Philip Sidney* (New York 1904); Symonds, J. A., *Sir Philip Sidney* (London 1886, New York 1906); Greville, Fulk, *Life of the Renowned Sir Philip Sidney* (London 1816, Oxford 1907); Wallace, M. SIDNEY, city, Ohio, and Shelby County seat, alt. 1,002 feet, on the Miami River; on the Baltimore and Ohio, and the Cleveland, Cincinnati, Chicago and St. Louis railroads; by rail, 38m. N. of Dayton. It is a manufacturing city, making many kinds of machinery, aluminum ware, electric refrigerators, paper-folding machines, and cigars. Civic buildings include a municipal building, a public library, and a county law library. City government is administered by mayor and council. Pop. (1940) 9,790; (1950) 11,491.

SIDNEY LUSKA. See HARLAND, HENRY.

SIDNEY SUSSEX COLLEGE, Cambridge, England, was founded in 1596 under the will of Lady Frances Sidney, countess-dowager of Sussex, aunt to Sir Philip Sidney. The charter was granted in 1594 by Queen Elizabeth to Henry, Earl of Kent and Sir John Harrington, the executors. The present society consists of a master, 11 fellows and 36 scholars. There are 10 fellowships, 24 scholarships, and a number of exhibitions. The scholarships and exhibitions connected with the college are: 30 scholarships varying in value from $150 to $250 a year and five exhibitions, besides several prizes. The college was erected on the site of an ancient Franciscan convent. It consists of two courts much defaced by modern alterations. Oliver Cromwell and Thomas Fuller were members of this college. There are eight church livings in the patronage of the college.

SIDON, sī'dŏn, (Heb. *Zidon;* Arabian *Saida*), anciently a city of Phoenicia (q.v.), on the Lebanese coast of the Mediterranean, lies midway between Sur (Tyre) and Beyrouth. It is surrounded by a wall with two gates. Its chief interest is historical. It was a wealthy city, with an excellent harbor and much commercial enterprise, being specially noted for purple dyes. It was watered by the streams of Lebanon, and many allusions to it are found in secular and scriptural writings. Sidon was referred to as "The first-born of Canaan"; Homer alludes to the ingenious Sidonians and their artistic handiwork. The town was famous for its manufactures of glass, linen, purple dye and perfumes. The Sidonians had their own monarch, but it was once subject to Tyre, and later to the Persians. It passed through many vicissitudes, finally passing over to the Moslems (1291). In the 17th and 18th centuries it became the seat of French commerce. It is now called Saida. Interesting sarcophagi have been found here (now in Istanbul). The present town was stormed by the Allies under Napier in 1840. Pop. (1940) 12,000, most of whom are Mohammedans. See LEBANON.

SIDRA, Gulf of (ancient SYRTIS MAJOR), Tripoli, a wide gulf of the Mediterranean Sea between the main portion of Tripoli and the plateau of Barca. Its coastline of over 500 miles is beset with shoals and sand banks, offering no harbor except Bengazi, at the extreme eastern end. See SYRTIS.

SIEBENGEBIRGE, zē'bĕn-gĕ-bēr'gė (Seven Mountains), Germany, a small chain of mountains near the Rhine, in Rhenish Prussia, 20 miles above Cologne. Above the main range rise seven lofty summits, whence the name. These rugged heights are all crowned with ruins of ancient lordly castles of the 12th century. Ölberg is the highest peak (1,522 feet); while the Drachenfels (q.v.) is the more interesting. Cologne Cathedral was built from stones quarried in these Rhenish Mountains. Some of the peaks are ascended by specially built railways. The scenery is romantic and interesting.

SIEBERT, sē'bėrt, **Wilbur Henry,** American educator: b. Columbus, Ohio, Aug. 30, 1866. He was graduated at Ohio State University in 1888, from Harvard in 1889 and received his A.M. at Harvard in 1890. After studying in Germany he was associate professor at Ohio State University in 1898–1902, and professor from 1902 to 1925 when he became a research professor in history. He served four years as secretary of the faculty and several terms as acting dean of the College of Arts, Philosophy and Science. Among his many publications are *The Underground Railroad from Slavery to Freedom* (1898–1899); *The Government of Ohio* (1903); and numerous papers on the American Loyalists of the Revolutionary epoch.

SIEBOLD, zē'bŏlt, **Karl Theodor Ernst von,** German physiologist and zoologist: b. Würzburg, Feb. 16, 1804; d. Munich, April 7, 1885. He was a member of a family of scientists. After studying at Göttingen and Berlin, in 1840 he was appointed professor of physiology at Erlangen, in 1845 at Freiburg and in 1850 at Breslau. In 1853 he was given the chair of physiology and comparative anatomy at Munich, with later appointment as professor of zoology and director of the zoological and zootomical cabinet. He is remembered as the rediscoverer of parthenogenisis in insects and for his studies of the intestines of worms and fish. In 1849 he was one of the founders of the *Zeitschrift für Wissenschaftliche Zoölogie.* Among his monographs are *Observationes de Salamandris et Tritonibus* (1828); *Lehrbuch der vergleichenden Anatomie der Wirbellosen Tiere* (1848); *Wahre Parthenogenesis bei Schmetterlingen und Bienen* (1856); *Beiträge zur Parthenogenesis der Anthropoden* (1871).

SIEBOLD, Philipp Franz van, German physician and traveler: b. Würzburg, Feb. 17, 1796; d. Munich, Oct. 18, 1866. His books on the Japanese, their language, customs, flora and fauna, did much to make Japan known to the western world. His works include *Nippon, Archiv zur Beschreibung von Japan* (1832–1851); *Fauna japonica* (1833); *Flora japonica* (1835); *Bibliotheca japonica* (1833–1841); *Epitome linguae japonicae* (1826–1853); *Florae japonicae familiae naturales* (1851).

SIEDLCE, or **SYEDLETS,** city of Poland, about 60 miles east of Warsaw in the department of Lublin. It is approximately the same distance west of Brest Litovsk. In 1906 it was the scene of a Jewish massacre. It suffered greatly during World War I and in the succeeding Russo-Polish War. The Poles recaptured it from the Russians in 1920. When Germany defeated Poland at the commencement of World War II and partitioned the country with Russia, Siedlce was included in the German area. On July 31, 1944, the German defenses fell before the Russian advance on Warsaw under Gen. K. K. Rokossovsky. Pop. (1940) 36,927.

SIEGBAHN, sēg'bän, **Karl Manne Georg,** Swedish physicist: b. Orebro, Sweden, Dec. 3, 1886. After receiving the degree of doctor of science at the University of Lund in 1911, he was a lecturer there until 1920 when he became professor and head of the physics department. From 1923 to 1937 he headed the physics department of the University of Uppsala. In the latter year he was appointed research professor and director of the Nobel Institute for Physics in Stockholm's Academy of Science. He is the recipient of many awards including the Nobel prize for physics (1925) and the Royal Society's Hughes Medal (1934) and Rumford Medal (1940). He is a contributor to scientific journals and wrote *The Spectroscopy of X-Rays* (1925).

SIEGBURG, zēĸ'bo͝orĸ, city, Rhine Province, Prussia, Germany, on the Sieg River, 14 miles southeast of Cologne. Pop. (1939) 19,405.

SIEGE. Three important elements are necessary to insure the success of a siege. First, the force of the besiegers must be sufficient to overcome the besieged in actual combat, man to man. If this is not the case the besieged, by a sortie, might destroy the opposing works, and drive away the besiegers. The second element is, that the place must be invested; so that no provisions, reinforcements, or other aliment of war can enter. The third element is, that the besiegers be undisturbed from without. For this it is essential that there shall not be a hostile army in the neighborhood; or, if there be, that the operations of the besiegers be protected by a covering army able to cope with the enemy's force in the field. The ancients executed gigantic works to produce these effects. To complete the investment, they built a high and strong wall around the whole fortress; and to render themselves secure from without, they built a similar wall facing outwards, beyond their own position. The first was circumvallation, the second contravallation. It was thus that Caesar fortified himself while besieging Alexia, and maintained 60,000 men within his ring. In modern warfare, it is considered preferable to establish strong posts here and there round the place, and merely sentries and vedettes between.

The first step toward the reduction of a fortress is to cut off communication of the occupants with the outside world. This is done by a rapid movement of a relatively small force followed by reinforcements sufficient to hold a line entirely around the place and beyond the range of its artillery. This line is called the "Line of Investment," and the belt of territory immediately outside of it occupied by the investment force is called the "zone of investment." Whether this line must be occupied continuously will depend upon its nature. As much must be actually occupied or commanded as could be used by the besieged for exit or entrance. The line of investment is divided into sections, preferably so chosen that a unit of command can be assigned to each.

Troops assigned to a section of the zone of investment begin at once to reconnoiter it and put it in the best possible state of defense. Artificial or accidental features are prepared and strengthened, intrenchments thrown up where required, communications made and improved through and between sections and telegraph and telephone lines established around the zone and to headquarters. Every means must be utilized to gain knowledge of the ground inside the zone. The time which must elapse before the siege material can be brought up will permit a great deal of such work to be done.

The real attack or systematic approach is pushed inward from a few points only of the zone of investment, usually one or two. The side on which these approaches are made is determined by the following conditions: (1) The best communication with the base; (2) The best terrain for battery positions and approaches under natural cover; (3) The most favorable ground for construction and operation of siege railways; (4) The easiest digging; (5) The most important consequences of success.

The first condition is usually controlling, unless one of the others is prohibitory. If the zone of investment is favorable and ample siege railway equipment is available, the attack may be conducted from points somewhat removed from the main terminus of the supply line. The main defensive line of an important fortress consists of a series of detached forts. To breach such a line one fort at least, more often two, must be taken, and during the operation the fire of the one on each side must be kept down. If two forts are to be reduced, the siege consists of artillery work against four and trench work against the middle two of these. When the front of attack is decided the main engineer park is located out of reach of the defenders' artillery, convenient to the front selected and to the main supply line, and connected with the latter by good communications. Here is assembled all the siege material pertaining to engineering operations as fast as it arrives, to be sorted and arranged in convenient shape for selection and forwarding to the front as required. Sites for the main siege batteries are next selected, at moderately long range from the forts, 2,500 to 4,000 yards, and for intermediate parks near them to con-

tain materials for the construction, repair and supply of batteries. These sites are connected by a belt railroad immediately in their rear, and the belt line is connected with the main park at one or more places.

The complete investing force must be heavily reinforced, ordinarily about doubled, before siege operations on any considerable scale are undertaken. The additional force is concentrated along the front of attack, mainly toward its centre. This and the investing force along the front of operations are sometimes called siege troops, and the remainder of the investing force distinguished as investing troops. The siege force should consist of infantry, engineers and artillery in the proportion approximate of 83 per cent, 5 per cent and 12 per cent, respectively, with the proper contingent of the signal and hospital corps and supernumerary engineers and ordnance officers. The total attacking force ranges from two and one-half to four times the strength of the garrison. The siege artillery is disposed in batteries of four pieces or less, dispersed as much as concentration of fire will permit, and sited when possible on the reverse slopes of ridges or hills or behind timber, and employs indirect fire almost exclusively. Though batteries are invisible, the high-angle fire of the defense reaches them, as the enemy's artillery systematically searches all reverse slopes within range, and the effect of shells must be localized by artificial cover. An emplacement for each gun is best.

First Parallel.— When the siege batteries have brought the artillery fire of the defense under control, the first attempt to gain ground to the front is made by opening a trench generally parallel to the line of investment and, if possible, within 1,200 yards of the enemy's main line. During the day the outposts are advanced to or beyond the proposed line, to permit it to be reconnoitered and its bearings noted. At night the attack is pushed more strongly and the enemy driven in as far as possible for the greater safety of the working parties. As soon as it is dark enough for concealment the tracing is begun. Each party consists of one engineer officer, one non-commissioned officer and a private for each 50 yards of line to be traced. Approaches or zigzag trenches must be traced and dug on the same night with the first parallel, connecting it with cover in the rear. There should be at least three such approaches — at right, left and centre. The tracing of approaches for simultaneous digging differs in detail but little from that of the parallel. It is more difficult because the line is broken and greater accuracy is required. The digging of approaches under fire differs from ordinary trench work in that it is done progressively from one end and with the men reasonably protected from fire while doing it. Tracing is dispensed with. Approaches are usually called «saps,» the operation of digging them «sapping,» and the skilled men «sappers.» The end at which digging is in progress is called the saphead.

Single Sap.—A party of one non-commissioned officer and eight sappers in two reliefs work at the saphead. The two leading sappers, Nos. 1 and 2, excavate a trench four and one-half feet deep and just wide enough to work in, throwing the earth to the front of the exposed side. They are protected in front, or on the end of the trench, by a pile of half-filled sand bags, 50 or 60 in number, piled so as to make a parapet two feet high. The sand bags should be smeared with mud so as to show the color of the soil. No. 1, kneeling or crouching, undercuts the end breast a few inches and brings down the earth. He steps back and No. 2 takes his place and shovels the loose earth out. No. 1 returns, throws forward as many sand bags as may be necessary to gain ground, using a fork or rolling them over with his hands. He then undercuts again and the operation is repeated. Nos. 3 and 4 widen the trench two feet and raise the parapet, also forming a berm 12 to 13 inches wide. The rate of advance of a sap is only two to four feet an hour. When half a yard has been gained, Nos. 1 and 2 exchange places, and when a yard is gained the other relief comes in. At each change of reliefs the men who were Nos. 3 and 4 on the last tour take 1 and 2. Casualties are made up from the waiting relief. Generally, unless reduced to less than four men, the detachment must work without reinforcement until the regular change of trench relief. A working party of infantry, 25 feet in rear of the sappers, widens the trench to 10 feet.

Double Sap.— Two parties work parallel to each other, Nos. 1 and 2 leaving a four-foot tongue between them, which is taken out by Nos. 3 and 4. No widening party is required. To prevent enfilade the direction of the trench is changed at right angles as soon as the plunging fire becomes too annoying. After going 25 to 30 feet laterally, the trench turns again to the front, and, after having advanced sufficiently to form a traverse, turns again to the right until it reaches the original line, when it resumes the main direction.

Second Parallel.—The first infantry position established, a second one well advanced is the next objective. It is called the «second parallel» and should be 500 or 600 yards from the enemy's works, or about midway in front of the first parallel. It will develop only the work selected for attack and will thus be shorter than the first. The second parallel, and the approaches to it from the first, may be established in a night, like the first parallel and its approaches, though this will be the exception. With an alert defense the advance from first to second parallel must be by sap. When the heads of the saps are abreast of each other and on the desired line, they may be turned toward each other and run to a connection, forming the second parallel, though, if possible the work should be expedited by extending parties for simultaneous work.

Third Parallel.—This is about halfway from the second parallel to the enemy's works and is in most cases the position of assault, though sometimes fourth and even fifth parallels have been found necessary. At this close range attention is necessary to guard the sapheads, which can be done by machine guns and rifle fire from the second parallel. As the saps advance the returns may be lengthened and turned so as to form demi-parallels. This enables a stronger guarding force to be kept under shelter and well advanced to repulse sorties or to take the offensive if opportunity offers.

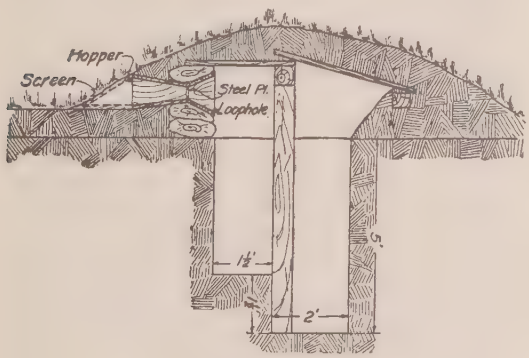
Simultaneous Work.— The preceding shows

the systematic method of procedure with the least losses. However, if the enemy's artillery is fairly well under control and if the terrain is at all suitable, two or more of the parallels or demi-parallels may be constructed at the same time. This result is obtained by sending working parties at night to the position of the advanced parallel or demi-parallel, and these parties hurriedly construct enough of the parallel to obtain shelter against the enemy's fire. During the day and subsequent nights this parallel is completed and the approaches to it are more quickly constructed because working parties are actively engaged at both ends. It is quite often necessary to construct a fourth and fifth parallel in order to maintain troops near the sapheads and protect the sappers at work.

The developments during the great World War and the methods of conflict in trench warfare due to the advances in science, hand grenades, bombs, obstacles, etc., have brought about important changes in the old methods of siege warfare. The essential difference between capture of entrenched places and victory over extended entrenched fronts lies in the fact that the garrison only of the fortress must be subdued while the nation back of an extended front well entrenched must be conquered. While the garrison of a fortress still retains numbers, food, ammunition and morale it may be possible to capture local strong points, but the garrison will not surrender as long as its power of resistance is not broken; other strong points to the rear will be occupied and the resistance continued. It is thus seen that the real objects of trench warfare are to capture local strong points and to break down the resistance of the enemy, making the following general principles self-evident:

(1) Advance in the open is impossible against enemy fire superiority.

(2) Advance by open sap work is difficult against enemy artillery fire and almost impossible if the enemy has artillery fire superiority.



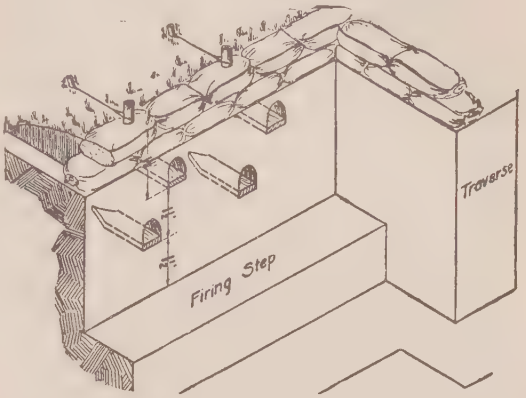
Enclosed Trench.

(3) Advance by mining is effective if the enemy has artillery fire superiority.

(4) An assault against an alert enemy must be preceded by an effective fire of artillery explosive shells to destroy somewhat the enemy trenches and obstacles.

(5) An artillery curtain of fire must be maintained beyond captured enemy trenches in order to assist the successful attackers in defending the captured trenches against counter attack.

The situation on the west front in Europe illustrated the effect of having masses of trained men facing each other on a relatively short line. From the North Sea to the boundary of Switzerland the battle line extended over a distance of 430 miles. The opposing armies had each constructed triple lines of



Sortie Steps in Face of Trench.

trenches, often supplemented in the rear by a double line of underground shelters where the troops in reserve might rest. Many miles of passageways, saps, galleries and zigzags afforded means of communication between the trenches. At a number of points the hostile lines were less than 100 yards apart and grenades of all types were used in great quantities. There were no flanks to turn, the lines were heavily covered by obstacles, and each side having reserves upon reserves, sapping and mining was freely resorted to in order to gain ground.

The observation of the enemy is of the greatest importance in trench warfare. It should give complete knowledge of all the elements of the hostile line and prompt information of any movement of the enemy. It is effected by observation from the ground and observation by aircraft. Observation from the ground is divided into three echelons: (1) observation in front of the firing line from small posts and listening posts. (2) Observation on the firing line by sentinels and lookouts. (3) Obersvation in rear of the firing line, by artillery observers, sentinels and lookouts of the shelters.

The location of the lookout posts and observatories are determined in accordance with a complete plan for each supporting point or sector of defense. No part of the hostile front should be free from observation and the parts of the front favorable for the attack of the enemy should be specially watched. An observatory should be located near the command posts of the commanders of strong points, supporting points and sectors. Those of the last two must have extended views over the whole of the terrain.

During a bombardment, the maintenance of lines of information becomes very difficult, but it must be accomplished by all possible methods, such as: (1) Installing telephone under strong shelters. (2) Using lead-covered cable, buried six feet deep, especially for the

lines connecting the regimental, brigade, division and corps headquarters. (3) Placing rockets in all shelters and observatories where officers or non-commissioned officers are posted. (4) Preparing posts for visual signaling, safe from bombardment and defiladed from view of the enemy. These posts are constructed in shelters similar to those for searchlights and are provided with horizontal loopholes with openings to the flank or rear.

Battle-field illumination is a necessity whereever night attacks may be expected. Portable searchlights, both animal and motor drawn, in units up to 36 inches, are now an accepted part of every army. In addition to these powerful lights, trenches are supplied with storage battery or gas reflector lights, star-bombs, rockets and flares, arranged so that they can be put into action instantaneously when an enemy approaches. The entire foreground and obstacles must be illuminated, leaving the defenders in shadow. If a light is used too close to the defenders' parapet, they themselves are illuminated and the light becomes a source of danger.

The use of asphyxiating gases as an auxiliary, both in attack and defense, was frequent in the World War, but was confined to operations where the combatants were facing each other in trenches under conditions similar to a siege. Chlorine or bromine fumes, or a mixture of the two, were the gases most commonly employed. Chlorine and bromine cause death through strangulation by effect on the bronchial tubes and if death is avoided a long, slow, bronchial illness ensues. *Mustard gas* because of its persistency and effectiveness in low concentrations was used ordinarily, in the World War, to gas large areas. For this purpose accuracy in hitting a given point was not necessary and hence the increase in the dispersion of shots at longer ranges was not taken into account as in the case when it was desired to hit a given point. Likewise the number of guns required to cover a given area was small. The high explosive shell, however, changes this method of firing. Since it is deadly both as a high explosive and as a gas, it can and will be used against small targets. In fact, it will be used exactly as high explosive is used, with the single exception that care must be taken to allow sufficient time for the gas to disperse if it is desired to occupy the places bombarded with the gas.

Mounting heavy artillery on railway cars has in no small degree affected siege operations. The idea of so mounting artillery was not born of the war with Germany. The idea was originally American, the first authenticated record of such employment being by the Union forces at the siege of Richmond in 1863, when a 13-inch cast-iron mortar was mounted on a reinforced flat car. In 1913 the commanding officer of the defenses of the Potomac recommended that artillery of various calibre be mounted on railroad platforms, with ammunition, range-finding and repair cars making up complete units, so that this armament could be quickly transported at any time to the place where most needed. It was then apparent that guns in *fixed positions,* of whatever calibres, violated the cardinal military principle of mobility. Of late railway artillery has come to be as varied in its design as field artillery, each type of railway mount having certain tactical uses, the three types of cannon used being mortars, howitzers and guns. The general types of railway mount adopted are those which give the gun all-around fire (360-degree traverse), provide limited traverse for the gun and allow no lateral movement for the gun on the carriage, but are used on curved track to give the weapons traverse aim. When war was declared against Germany the guns in the United States available for mounting on railway cars are shown in the following table:

NUMBER OF GUNS	Size	Length
	(*Inches*)	(*Calibres*)
12	7	45
96	8	35
129	10	34
49	12	35
6	12	50
150 (Mortars)	12	10
21	14	50

The smaller weapons, such as the 7-inch and the 8-inch guns and the 12-inch mortars, were placed on mounts affording 360-degree traverse. The limited traverse mounts were used for the moderately long-range guns and howitzers. The fixed type of mount was used for long-range guns only, including the sliding railway mounts, such as the American 12-inch and 14-inch sliding mounts and the French Schneider à glissement mounts.

In siege operations, as the result of experience, railway artillery is practically confined to the Barbette, Schneider and Batignolles types of gun mounts. The *Barbette* carriage revolves about a central pintle or axis and turns the gun around with it. In the *Schneider* railway mount the gun and its carriage are fastened rigidly parallel to the long axis of the railway car. Thus the gun itself, independently of any movement of the car, can be pointed only up and down in a vertical plane, having no traverse or swing from left to right, and vice-versa. In order to give the weapon traverse for its aim, special railway curved tracks, called epis, are prepared at the position where it is to be fired. The car is then run along the curve until its traverse aim is correct and the vertical aim is achieved by the movement of the gun itself. In the *Batignolles* type the gun and cradle are mounted on a so-called top carriage that permits of small changes in horizontal pointing right and left. Thus with the railway artillery of the Batignolles type, also, track curves, or epis, are necessary for the accurate aiming. This mount partially cushions the recoil by the movement of the gun itself in the cradle.

While siege operations are largely modified by the advent of military aeronautics, the changes are not great because of the limited weight that the largest airship can carry. The effects of the largest bombs are less terrifying and important than those of the enormous number of gun projecticles, which are thrown with greater accuracy and usually from guns that cannot be seen by those attacked or besieged.

EDWARD S. FARROW,
Late Consulting Military and Civil Engineer.

SIEGE ARTILLERY. See ARTILLERY.

SIEGE GUN. See ARTILLERY; FORTIFICATIONS.

SIEGEN, zē'gĕn, **Ludwig von,** German-Dutch inventor: b. Utrecht, 1609; d. Wolfenbüttel, 1680. He was a lieutenant in the Hessian army and invented the art of mezzotint engraving which was learned from him by Prince Rupert and so introduced into England. His first work was a portrait of Amelia Elizabeth, mother of the landgrave of Hesse (about 1640).

SIEGEN, Germany, Prussia, a town in the province of Westphalia, on the Sieg River, 47 miles east of Cologne by rail. Two castles, belonging to the period of the Principality, are in this town, several Protestant and Catholic churches, a monument to William I and a bronze bust of Bismarck. It has important mining and manufacturing interests and is the centre of the mining industry of southern Westphalia. It has large tanneries, foundries, factories for cloth, linen, soap, leather and paper, etc. There is a school of mining. Siegen is supposed to be the birthplace of Rubens. Pop. about 30,000.

SIEGFRIED LINE. See FORTIFICATIONS.

SIEGFRIED, sēg'frēd (Ger. zēg'frēd). See NIBELUNGENLIED.

SIEMENS, zē'mĕns, **Ernst Werner von,** German engineer and electrician: b. Lenthe, Hanover, 13 Dec. 1816; d. Berlin, 6 Dec. 1892. He entered the Prussian artillery in 1834 and took out his first patent in 1842 for a process of silver and gold electro plating. In 1842 he went to England with his brother, Karl Wilhelm, to establish the business known there by the firm name of Siemens Brothers. In 1844 he took charge of the artillery workshops in Berlin. He aided in developing the telegraphic system in Prussia, and discovered the insulating properties of gutta-percha, which is utilized in underground and submarine cables. He left the army in 1849 and devoted his energies to electrical business, particularly the construction of telegraph apparatus. The first great continental telegraph line, that between Berlin and Frankfort-on-the-Main, was built by him in 1849, and the firm of Siemens Brothers laid six Atlantic cables. The pneumatic-tube system was invented by him and also various modifications of self-acting dynamos. In 1886 he gave 500,000 marks to found an institute of physics and technology. He published 'Positive Vorschläge zu einem Patentgesetz' (1869); 'Gesammelte Abhandlungen und Vorträge' (1881); 'Wissenschaftliche und technische Arbeiten (1889–91); 'Lebenserinnerungen' (1892). His collected 'Papers' were translated into English (1892–99), also his 'Recollections' (New York 1893).

SIEMENS, SIR **Karl Wilhelm,** German-English physicist and inventor: b. Lenthe, Hanover, 4 April 1823; d. London, 19 Nov. 1883. He was educated at the gymnasium at Lübeck, the polytechnic school at Magdeburg and the University of Göttingen. At 19 he became a pupil in the engine works of Count Stolberg, and a year later visited England for the purpose of introducing a method of electro-plating, the joint invention of his brother Werner and himself. In the same year the brothers invented a differential governor for steam-engines, and in 1844 he again went to England to patent this invention. From that time he settled in England, becoming naturalized in 1859. Among the many other inventions with which he, in combination with his brothers, must be credited, are the regenerating gas furnace for metallurgical purposes, the process of making steel and iron direct from ore, which has revolutionized the steel and iron trades, and improvements in the manufacture and laying of telegraph lines. He was elected to the Royal Society in 1862; was one time president of the British Association; and was knighted in 1883. He published 'On the Utilization of Heat and Other Natural Forces' (1878); 'The Dynamo Electric Current and its Steadiness' (1881); 'On the Conservation of Solar Energy' (1883). His 'Scientific Works' were edited by E. F. Bamber (1888). Consult Pole, Dr. 'Life of Sir William Siemens' (London 1888); 'Dictionary of National Biography' (London 1897); *The Times* (London, 20 Nov. 1883).

SIEMERING, zē'mĕr-ĭng, **Rudolph,** German sculptor: b. Königsberg, 10 Aug. 1835; d. 23 Jan. 1905. He attended the local Art Academy in youth and afterward became the pupil of Blaser in Berlin. For the decoration of Königsberg University he furnished medallion portraits of its learned men. In 1860 he produced his 'Penelope' and in 1860 a sitting figure in marble of King Wilhelm for the Exchange in Berlin; and a terra-cotta statue of Leibnitz for the Academy of Science at Perth, productions remarkable for realistic modeling and imposing expression. In 1871 he executed the masterly relief 'Uprising of the People at the Summons of their King'; and the following year a design for the Goethe monument. His next work was the statue of Frederick the Great for Marienburg. The greatest of his works, however, was the war monument in the market place at Leipzig, 'Germany,' as an armed heroine. Worthy also of special notice was the sitting statue of Emperor William I with the four colossal equestrian figures — King Albert of Saxony, Emperor Frederick, Bismarck, Moltke and eight figures of soldiers. He was the author of the colossal equestrian statue of Washington whose pedestal is enriched with reliefs and accessory sculptures. This impressive monument was unveiled in Fairmount Park, Philadelphia, May 1897. Siemering's group, 'Saint Gertrude Hospitably receiving a Traveling Scholar,' was finished and set upon the Bridge of Saint Gertrude at Berlin in 1896. He was also the author of numerous portrait busts.

SIEMIRADZKI, syĕm-ĭ-räz'kĭ, **Henryk,** Polish painter: b. near Kharkov, Grodno government, 15 Nov. 1843; d. 1902. He studied art in the Academy of Saint Petersburg and after a sojourn in Munich, fixed his studio in Rome. Among his best canvases are 'Nero's Torches' (1876) now in the National Museum, Cracow; 'The Vase or the Slave' (1879); 'The Amulet-Seller' (1888); 'Christ Stilling the Waves'; 'The Sword Dance' (1880); 'Phryne at Eleusis' (1889), in the Alexander Museum, Petrograd; 'Christ with Martha and Mary' (1886). He also decorated with much skill two ceilings in the Netchaïev Palace of Petrograd and several churches of Cracow and Moscow.

SIENA, syâ'nä, Angl. sĭ-ĕn'à, province, Italy, in Tuscany, comprising hills and mountains of the Tuscan Apennines between the Chianti Mountains in the northeast and the Monte Amiata group in the southwest. The area is 1,475 square miles, with the Ombrone, Elsa, and Arbia the chief rivers. The valley farms yield olives, cereals, grapes, and other fruits. Livestock too is raised. Much of the famous Chianti wine comes from the province. There are also mercury mines and quarries that yield travertine and a fine orange-colored marble. Siena, the capital, San Gimignano, Montepulciano, and Poggibonsi are the principal centers. A railway line from Empoli to Chiusi crosses the province and has a branch running to the coast to Follonica. Pop. (1951) 277,036.

SIENA, commune and city, Italy, the capital of Siena Province in Tuscany. The city is 30 miles south of Florence on a plateau about 1,000 feet high, in the midst of hills covered with vineyards and olive groves. The atmosphere has changed little since the Middle Ages. In its landmarks and plan Siena is still a 14th century city, with narrow, irregular streets and small, picturesque squares lined with old palaces and medieval houses. In the center of the city is a wide, shell-shaped square, the Campo, dominated by the imposing Palazzo Pubblico with the tall and slender Torre del Mangia. This is the finest Gothic town hall in Tuscany. Among its works of art are Simone Martini's *Maestà* and frescoes by Ambrogio Lorenzetti. In the square also are the Loggia della Mercanzia and the Fonte Gaia, a fountain by Jacopo della Quercia; copies replace his original sculptures now in the municipal museum. The famous *Corsa del Palio*, a festival of medieval origin, is still held twice every summer in the Campo. It consists of a parade and a horse race, the oldest in the world. The paraders, in colorful medieval costumes, represent each of the city's 17 quarters (*contrade*), and in the horse race, each horse runs under the colors of one of the 10 *contrade* chosen to take part in the race.

Siena's beautiful cathedral (12th–14th century) has a polychrome marble façade. The lower part, by Giovanni Pisano, is Romanesque; the upper part is a striking example of Italian Gothic. Walls and columns of the interior are covered with stripes of black and white marble, and the marble floor is beautifully inlaid. The sculptured pulpit is by Nicola Pisano, aided by his son Giovanni and others. The high altar is by Baldassare Peruzzi. The adjacent Piccolomini Library, founded about 1495 by Francesco Piccolomini (later Pope Pius III), has frescoes by Pinturicchio (1502–1509). Near the cathedral are the baptistery, with a beautiful baptismal font by Jacopo della Quercia and works by Donatello and Lorenzo Ghiberti, and the Museo dell'Opera del Duomo. Among the city's fine churches are Sant'Agostino, Fontegiusta, Santa Maria dei Servi, and San Francesco.

In the 14th-century Bonsignori Palace is the art gallery, a collection of paintings of the Sienese School, which produced its greatest masters in the 13th and 14th centuries with Duccio di Buoninsegna, Simone Martini, Lippo Memmi, and Pietro and Ambrogio Lorenzetti. Other palaces of that period are the Piccolomini, Tolomei, Sansedoni, and Saracini. The home and shrine of Saint Catherine of Siena, who was born and lived here, contains many relics. Scenes of her life, painted by Sodoma, are in the Church of San Domenico. Siena has fine cultural traditions dating back to the 13th century, when its university was founded. There are many academies and learned societies, a municipal library, and a museum of antiquities.

Siena was an Etruscan settlement long before Roman times, but we do not know its Etruscan name. Under a Latin name it first appears in history as a Roman colony in the times of the emperor Augustus. Later it was held by Goths, Lombards, Franks, and local feudal lords, over whom the bishops finally gained ascendancy. In the 12th century a free commune was formed, which gradually extended its power over the countryside and soon became the champion of the Ghibelline cause in Tuscany. Meanwhile the Guelph city of Florence also tried to enlarge its possessions. The ensuing political and economic rivalry soon led to a series of wars, fought with varying fortunes. After its victory over Florence at Montaperti in 1260, Siena reached its highest intellectual, artistic, and economic development. In the 14th and 15th centuries, however, external wars and internal strife between Guelphs and Ghibellines (q.v.) and between the aristocratic and popular factions gradually weakened the republic. From 1497 to 1512 Pandolfo Petrucci held power and tried to restore order, but his son was forced into exile in 1516. French and Spaniards fought over Siena, and in 1554 troops of Emperor Charles V put the city under siege. After a long and gallant struggle to save their republican liberties the defenders were forced to capitulate in April 1555. Charles V invested his son Philip with Siena, but in 1559 the city passed to the Medici, and remained a part of the Grand Duchy of Tuscany until 1860, when it joined Piedmont and later became part of a united Italy. Siena suffered little during World War II, but several private art collections were looted by the Germans.

There are no important industries. Silk and cotton textiles are manufactured, as well as handmade leather objects, wrought iron, ceramics, and fine furniture. Pop. of the commune (1951) 52,226.

SIENNA, sĭ-ĕn'à, a natural pigment consisting of clay colored by iron and manganese oxides, brownish yellow in its raw state and orange-brown when burnt. Its name derives from Siena, Italy, where one of the finest deposits has long been worked. Sienna dates from the time of the pre-civilization cave dwellers, and has been used in all periods of European art. It is indispensable to the modern paint industry.

SIENKIEWICZ, shĕn-kyĕ'vĕch, **Henryk**, Polish novelist: b. Wola Odrzejska, near Lukow, Poland, May 4, 1846; d. Vevay, Switzerland, Nov. 14, 1916. Educated at the University of Warsaw, Sienkiewicz published various critical articles (1869) while still a student, was for a time editor of *Słowo*, a journal published in Warsaw, and in 1872 published his first work of fiction, *Na Marne*, rendered into English by the official translator, Jeremiah Curtin, as *In Vain*. In 1876, Sienkiewicz came to the United States, where for a time he lived in California in a Polish colony founded by the famous Polish-American actress Helena Modjeska and her husband. His travels took him to most of the European countries and even into central Africa. Among his chief works are the

following, nearly all translated by Curtin: *With Fire and Sword* (1883), *The Deluge* (1886), and *Pan Michael* (1888)—the three forming a great patriotic trilogy which deals with Poland's struggle for freedom in the 17th century and is regarded as Sienkiewicz's finest work; the two distinguished psychological novels *Without Dogma* (1891) and *Children of the Soil* (1895); *Quo Vadis?* (1895; English tr. 1896), a tale of Roman life under Nero, by far the author's most popular work; and *Knights of the Cross* (1900). *Quo Vadis?* has been translated into nearly every modern language and dramatized and filmed with great success.

In 1905 Sienkiewicz received the Nobel Prize in literature. During World War I he worked untiringly for Polish independence and for the International Red Cross. It was in the midst of these labors that he died. The vast majority of the people of Poland regard him as their authentic national voice.

Consult Gardner, M. M., *The Patriot Novelist of Poland: Henryk Sienkiewicz* (New York 1926); Ledbetter, E. E., comp., *Polish Literature in English Translation,* bibliography (New York 1932).

SIERRA LEONE, sĭĕr'ä lē-ōn'; sĭr'ä, a British colonial territory (area 27,925 square miles) in British West Africa, consisting of a colony (256 square miles) and a protectorate (27,669 square miles). Roughly circular in shape, it lies between 6°55′ and 10°N. and 10°16′ and 13°18′W. Its 210-mile seacoast extends from French Guinea to Liberia. The colony consists of the Sierra Leone Peninsula, Sherbro Island, and other small islands. About 25 miles long and 10 to 12 miles wide, the peninsula consists of thickly forested igneous mountains rising to between 2,000 and 3,000 feet. Freetown (pop. 1954, 70,000), at the northern end of the peninsula, has one of the finest natural harbors in West Africa. The coastal strip of the protectorate is low and flat. In the west and south are rolling wooded areas, with hills of 1,000 feet or more. The upland plateau in the north and east lies at about 1,500 feet; the Sula and Kangari hills stand nearly 3,000 feet high, and the Tingri range rises to over 6,000 feet. Rivers and streams flowing into the Atlantic provide useful waterways, especially during the rainy season from May to October. Between December and February the dry northeasterly harmattan blows from the Sahara. Freetown's mean annual temperature is 80°F., its rainfall 135.81 inches. The total population was 2,005,000 in 1952 (mid-year estimate), of which about 2,000 were African and 1,000 Europeans.

All land belongs to the indigenous population, but, with the consent of the Tribal Authority and the District Council, non-natives may lease land for a term not exceeding 50 years. About 23,848 square miles are suitable for agriculture. The main crops are palm oil, palm kernels, piassava fiber, rice, cacao, coffee, peanuts, cassava, beniseed, kola nuts, bananas, and ginger. Animal husbandry is hampered by endemic animal and fowl disease. Mineral rights are held by the crown, and prospecting and mining rights are granted by the governor. Diamonds, chrome ore, iron ore, and gold form the chief mineral resources.

Total imports in 1954 amounted to £13,376,250, of which the chief items were cotton and artificial silk piece goods, clothing, machinery, iron and steel manufactures, and bags and sacks. Exports in 1954 totaled £11,398,305, most important of which were palm kernels, palm oil, cacao, diamonds, peanuts, coffee, beniseed, and minerals.

The state-owned Sierra Leone Railway has a total length of 337 miles; the Sierra Leone Development Company, Ltd., operates a 57½-mile freight line. There are between 2,500 and 3,000 miles of road, over 100 miles of it paved. Freetown is the chief harbor, but Pepel, Bonthe, and Sulima are loading ports for local produce. Freetown airport (at Lungi) is the only international airport. A telephone system links the major towns, and in Freetown there is a wired broadcasting system. Direct broadcasting was planned to come into operation in 1955.

Of the 372 primary and 20 secondary schools and post-primary departments in 1954, 19 were run by the government and 266 by missionary societies and local authorities assisted by the government; 107 were unassisted. The Labour Department maintains a technical training center at Wilberforce, and the Education Department provides commercial classes for clerks in government service. Fourah Bay College (affiliated with the University of Durham) offers courses in divinity, arts, commerce, and education. Five teacher training colleges and two teacher training departments also exist. Scholarships for secondary education and study abroad are liberally awarded.

Hospital facilities are provided by the government and by missions and mining companies; a total of 1,124 beds was available in 1953. There were also 29 government dispensaries.

The territory is governed by an Executive Council and a Legislative Council. The former, under the presidency of the governor, has four ex officio members and six ministers appointed from the elected members of the Legislative Council. The prime minister is the leader of the majority party in the Legislative Council, which is made up of the governor as president, a vice president, seven ex officio members, 21 elected members, and two members nominated by the governor. Local government is in the hands of area, district, and urban councils. Elections are both direct and indirect, and plans for a greatly broadened franchise have been approved.

Sierra Leone was discovered in 1462 by Pedro de Cintra, a Portuguese adventurer. For some two centuries it helped supply the slave trade. In 1788, the native chiefs ceded a portion of land to Capt. John Taylor, to be used as a settlement for slaves freed and destitute in England. When Great Britain abolished the slave trade (1807) it became a base for enforcing abolition. Africans repatriated from North America and those rescued from slave ships enlarged the population. Treaties with neighboring chiefs resulted in further territorial growth, and by 1911 the boundaries were stabilized. During World War II, Freetown harbor was a staging area for convoys.

RICHARD WEBB.

SIERRA MADRE, sĭ-ĕr'ä măd'rē; mä'drä; Span. syĕr'rä mä'thrä, (1) A range of mountains in southern California, in Los Angeles and adjoining counties. (2) A range in the southern part of Wyoming in Carbon County. (3) The range in Mexico bordering the plateau on the west. It is a continuation of the range on

the western border of the Great Salt Lake Basin in the United States. In Mexico, the range is sometimes called Sierra Madre del Pacifico. The Sierra Madre del Sur is located in southern Mexico. (See MEXICO—*Topography*) (4) One of the three principal mountain ranges in the eastern part of the island of Luzon, Philippines.

SIERRA MORENA, sĭ-ĕr'ä mō-rā'nä, southwest Spain, an irregular mountain chain which cuts across the provinces of Huelva, Badajoz, northern Seville, central Cordova, Jaen, southern Ciudad Real, and Albac. It forms the watershed between the Guadiana and Guadalquivir rivers and separates the plateau region of Castile and Estremadura from Andalusia (q.v.). In the west, the range includes the Sierra de Aracena, and in the east, the Sierra de Alcaraz near which is located the famous pass, Despenta Perros.[1] Sheep graze in the Cordova pastures, and the range is fertile in minerals including mercury, lead, zinc, iron, and the copper mines at Tharsis and Rio Tinto.

SIERRA NEVADA, sĭ-ĕr'ä nĕ-vä'dä (Span. for snowy range), a mountain range in eastern California, the geological development of which took place over a period of 50 million years. While it is the general opinion of geologists that the area is a tilted block of the earth's crust, conflicting views exist on the manner in which the dislocations took place. It ranges from about 430 miles long to 40 to 80 miles wide and is broad enough to bear several mountain systems on its back with altitudes up to 14,495 feet. Rising abruptly along the eastern side of a great fault escarpment facing Owens Valley, it slopes westward toward the Great California Valley.

In March 1772, Capt. Pedro Fages and Father Juan Crespi were probably the first white men to see the Sierra Nevada. Subsequent discoverers and explorers included Pedro Font and Francesco Garces, April 1776; Lieut. Gabriel Moraga, 1805, 1808; Lieut. Luis Arguello, Ramón Abella, and Narcisco Durán, May 1817; Jedediah Strong Smith (d. 1831); Joseph Reddeford Walker, October 1833, 1834; John C. Fremont, 1844, 1845; George Donner, 1846–1847; and William Penn Abrams, 1849. The beginning of systematic exploration took place with Josiah Dwight Whitney, William H. Brewer, and Charles Hoffmann, 1864; Clarence King, 1871; A. H. Johnson, C. D. Bergole, and John Lucas, 1873; John Muir, 1869; and many others associated with the United States Geological Survey have done extensive work.

Among the tallest mountains with altitudes given in feet[2] are Mount Whitney, 14,495; Williamson, 14,384; North Palisade, 14,254; Russell, 14,190; Corcoran 14,093; Middle Palisade, 14,049; Langley, 14,042; Tyndall, 14,025; Humphreys, 13,972; Darwin, 13,841; Kaweah, 13,816; Brewer, 13,577; Goddard, 13,555; Ritter, 13,161; Lyell, 13,095; Dana, 13,055; Clarence King, 12,909; Conness, 12,561; and Matterhorn, 12,275. Several of the better known peaks are Banner, 12,962; Tower, 11,707; Cathedral, 10,938, and Stevens, 10,100. The principal passes are Kearsage, 11,823; Tunemah, 10,883; Granite 10,681; Tioga, 9,946; Sonora, 9,627; Carson, 8,650; Donner, 7,150; Beckworth, 5,250; and Walker, 5,248. Upper Kern Canyon attains a depth of 6,300 feet opposite Mount Kaweah; Middle Kern Canyon ranges from 4,000 to more than 6,000 feet.

The forests of the Sierra Nevada are varied but are for the most part famous for their cone-bearing trees. The life zones include the foothill country; the Transition zone, covering from 2,000 feet to 5,000 feet in altitude, includes Yosemite Valley, Mariposa Grove, and the Giant Forest in Sequoia National Park; the Canadian zone, ranging from about 5,000 feet to 7,000 feet; and the Hudsonian zone which extends from there to the timberline.

SIERRA NEVADA, the loftiest mountain range of Spain. It extends east and west through Granada and Almeria, terminating on the Mediterranean shore where it forms several promontories. Mica slate is its chief constituent, and vegetation is scanty except in the lower valleys. Snow remains on the peaks the greater part of the year and there are several glaciers, those on Veleta being the southernmost in Europe. Its highest peak, Mulhacén, with an altitude of about 11,420 feet, is covered by perpetual snow; Veleta, next in height, also has an elevation of over 11,000 feet.

SIEYES, syā-yâs', **Emmanuel Joseph,** French statesman: b. Fréjus, May 3, 1748; d. Paris, June 20, 1836. He began his studies at the University of Paris, and when the Revolution broke out he took an active part in furthering its progress, and wrote three pamphlets on the mode in which the three estates were to vote, whereby he was brought into very general and favorable notice. With him originated the idea of a new geographical division of France into departments, arrondissements, and communes. He also took an active part in the formation of the new constitution, and was in 1791 member for the department of the Seine. In 1792 he was deputy for the department of the Sarthe, but generally contented himself with merely recording his vote. During the Reign of Terror he withdrew into the country, but on the downfall of Robespierre he returned to the convention and took an active part in public measures, more especially foreign affairs, conducting several important negotiations with other states. In 1798 he went on a mission to Berlin, and succeeded in securing the neutrality of Prussia. On his return in 1799 he succeeded Jean François Rewbell as a member of the Directory, and shortly after succeeded in displacing three of his colleagues, so as to obtain a majority favorable to his views. He afterward, with the assistance of Joseph Fouché, closed the Jacobin Club. This measure made him very obnoxious to the extreme Republican Party, and under the conviction that faction was now to be kept down only by force he began to look out for a military leader. He thought of several, but fixed at last on Bonaparte. The revolution of the 18th Brumaire was the result; but Sieyès, who hoped he had only obtained a coadjutor, soon learned that he had subjected himself to a master. He did not, however, retire unrewarded, but proved that the simplicity and disinterestedness of which he had boasted were more nominal than real, by

[1] Variously spelled: Despenaperros, or Despienaperros.

[2] These altitudes have been supplied especially for this article by the United States Department of the Interior, Geological Survey, and are, as of July 1949, what they consider the best approximations of the elevations.

obtaining, along with the title of count, grants of lands and other property to the value of at least $250,000. He wrote 'Reconnaissance et exposition des droits de l'homme et du citoyen' (Paris 1789). Consult Boulay, 'Théorie constitutionelle de Sieyès' (Paris 1836); Beauverger, Edmond de, 'Etude sur Sieyès' (in 'Tableau historique du progrès de la philosophie politique' (ib. 1858); Bigeon, 'Sieyès' (ib. 1873); 'Cambridge Modern History' (Vol. VIII, New York 1904); Neton, A., 'Sieyès, 1746–1836, d'après des documents inédits' (Paris 1900); Mignet, F. A. L., 'Notices et mémoires historiques' (Vol. I, Paris 1843).

SIFFLEUR, an American ground squirrel, nearly equalling a rabbit in size, common in the Rocky Mountain region. It is so called from the loud eerie whistle with which it wakes the echoes of the crags about the lone pastures above timber line, where it makes its home; it was of great service to the mountain Indians. See MARMOT.

SIFFU, sēf-foo', or **SIBBU,** sēb-boo', a river of the island of Luzon, Philippines. It rises in the eastern part of the province of Bontoc and flows south and east through the province of Isabela to the Rio Grande de Cagayan; it is one of the most important tributaries of the Cagayan in Isabela.

SIFTON, Arthur Lewis, Canadian jurist and statesman: b. Saint John's, Ontario, 26 Oct. 1858; d. Ottawa, 21 Jan. 1921. He was educated at Wesley College, Winnipeg, and at Victoria University, Cobourg. He settled in the Northwest Territory in 1875 and in 1883 was called to the bar. He served in the legislature of the Northwest Territory in 1899–1903; was treasurer and commissioner of public works in the ministry of F. W. G. Haultain (q.v.); and in 1903–05 he was chief justice of the Supreme Court of the Northwest Territory. Upon the establishment in 1905 of the province of Alberta he became chief justice of its Supreme Court, and in 1910–17 he was premier of that province.

SIFTON, SIR **Clifford,** Canadian lawyer and statesman: b. Middlesex County, Ontario, 10 March 1861. He was graduated at Victoria University, Cobourg, in 1880, settled in Manitoba and in 1882 was called to the bar. He sat in the Manitoba Legislature, 1888–96; was Attorney-General and Minister of Education in the Greenway Administration, 1891–96, when he left to become Minister of Interior and Superintendent General of Indian Affairs in the Laurier Dominion Administration. In 1905 he resigned owing to a disagreement with Sir Wilfred Laurier over educational clauses in bills to establish the provinces of Alberta and Saskatchewan. Chairman, Commission Conservation of Natural Resources, 1909–18. He died in 1929.

SIGEBERT OF GEMBLOUX, sezh'bėrt' ov zhăn'bloo', Belgian mediæval chronicler: b. Brabant, c. 1030; d. Gembloux, 5 Oct. 1112. He early became a monk in the Benedictine abbey of Gembloux, where, with the exception of a period as a teacher at Metz, he passed all his life in teaching, and writing the works that have perpetuated his name. Chief of these is 'Chronographia,' covering history from 381 to 1111 A.D. It appears in 'Monumenta Germania historica Scriptores' (Vol. VI, ed. with introd. by L. C. Bethmann). Other works are 'Vita Sigeberti III regis Austrasiæ,' a life of the Frankish King Sigebert III; 'Gesta abbatum Gemblacensium,' a history of the early abbots of Gembloux to 1048; and the hagiographical biographies, 'Vita Deoderici, Mettersis episcopi,' a life of Bishop Dietrich of Metz, d. 984, who founded Saint Vincent's Abbey in that city; and 'Vita Wicberti,' a life of Wicbert or Guibert, d. 962, who founded the abbey of Gembloux. Consult Hirsch, S., 'De vita et scriptis Sigiberti Gemblacensis' (Berlin 1841); Molinier, A., 'Les Sources de l'histoire de France' (Vols. II and V, Paris 1902–04); Wattenbach, W., 'Deutschlands Geschichtsquellen' (Vol. II, Berlin 1894).

SIGEL, sē'gĕl, **Franz,** American military officer: b. Sinsheim, Baden, 18 Nov. 1824; d. New York, 21 Aug. 1902. He was graduated from the military school at Carlsruhe in 1843 and was commissioned lieutenant in the army, but resigned in 1847. In 1848 he raised a corps of volunteers to serve in the Baden insurrection and became commander-in-chief of the revolutionists. Arrested by the Swiss authorities in 1851 he escaped and in 1852 came to the United States. He settled in New York and conducted there a military magazine *Die Revue,* removing in 1857 to Saint Louis where he established a similar paper and also engaged in teaching. At the outbreak of the Civil War he organized a regiment for the Federal army and went to the front; participated in the battles of Carthage, Dug Springs and Pea Ridge; and in May 1861 was commissioned brigadier-general of volunteers. He was promoted major-general in 1862 and assigned to a corps in the Army of Virginia, which he commanded in the series of operations from Cedar Creek to the second battle of Bull Run. He was appointed to command the Western Pennsylvania Reserves in 1863 and in 1864 was transferred to the command of the Department of Western Virginia, successfully defending Maryland Heights against General Early's raid in July 1864, though his force was but 4,000 men against 15,000. He resigned his commission after the war, was editor of the Baltimore *Wrecker* in 1865–67 and later removed to New York. He was appointed collector of internal revenue in 1871 and elected registrar of New York in the same year. In 1868 he was appointed pension-agent, and later edited the *New York Monthly,* a German-American publication, and was the author of various essays on military subjects.

SIGERSON, George, Irish poet, physician, botanist and educator: b. Holy Hill, County Tyrone, about 1839; d. 17 Feb. 1925. He was educated at Queen's College, Cork, and later studied in Dublin and Paris. He was professor of botany at the Catholic University, Dublin, and was afterward professor of zoology at University College, Dublin. He exercised a profound influence over the Celtic revival, was an authority on Irish literature and history and wrote ably on Irish land tenure, political prisoners and kindred subjects for the *Irishman,* the *Nation* (Dublin) and the *Harp.* He performed a notable service to Irish letters in his translation of Celtic poetry, 'The Poets and Poetry of Munster' (1860) and 'Bards of Gael and Gall' (1897; 2nd ed., 1907). His own

verse is well known and is included in the modern Irish anthologies.

SIGHING, an act of respiration beginning in an involuntary, often sudden, sometimes prolonged inspiration, in which the diaphragm descends; the expiratory act which follows, and which constitutes the "sigh," being caused by the recoil of the chest-walls and lungs and by the action of the abdominal muscles. Sighing usually illustrates simple respiration as modified by mental or emotional conditions or by some factor of sensation. During strained attention, as when listening to a thrilling speaker, or witnessing an exciting scene, the respirations become very short and quickly recurring, with an occasional long sighing inspiration at intervals.

SIGHT. See Eye; Senses; Vision.

SIGHT, Defects of. See Vision, Defects of.

SIGILLARIA, sĭj-ĭ-lā′rĭ-a, a genus of fossil plants found in great abundance in the coal measures. The plant occurs in the form of compressed stems attaining a height of 40 to 50 feet, and a breadth of five feet. The stem is seldom found preserved so as to show any structure or even its cylindrical form; it generally occurs as a double layer of coal, showing on the outer surfaces longitudinal furrows due to the arrangement of the leaves on the stem, and at regular intervals the scars produced by the bases of the leaf-stalks. The roots are found preserved in the shale which forms the floor of all coal seams; they were originally supposed to be distinct plants, and have received the generic name of *Stigmaria*. No foliage of any kind has been found connected with the trunk. Some suppose Sigillarias to be allied to tree-ferns, others to *Coniferæ*. King says that if in imagination we delineate a channeled stem of any height between 12 and 100 feet, crowned with a pendant fern-like foliage, furnished with wide-spreading fibrilled roots, and growing in some densely-wooded swamp of an ancient Mississippi, we will then have formed a tolerably close restoration of a sigillaria growing in its true habitat.

SIGISMUND, sĭj′ĭs-mŭnd (Ger. zē′gĭs-moont), emperor of Germany, son of Charles IV: b. 14 Feb. 1368; d. Znaim, Moravia, 9 Dec. 1437. He succeeded to the margraviate of Brandenburg on the death of his father, Emperor Charles IV, in 1378, while his brother Wenceslaus, king of Bohemia, succeeded to the throne. By his marriage to Mary, heir of Louis the Great, king of Poland and Hungary, he became heir-apparent to the throne of these two countries, but on the death of Louis in 1383 the Poles chose Hedwig, Louis' younger daughter, for their queen, and the regency of the Hungarian throne was seized by Charles Durazzo, while Mary was kept in captivity. Sigismund rescued her and on the murder of Durazzo was crowned king of Hungary in 1387. His war against the Turks, though supported by the French and German chivalry, resulted in a disastrous defeat at Nicopolis in 1396, and Sigismund was compelled to escape into Greece. On his return to Hungary in 1401 he found his queen dead, his throne occupied by Ladislaus of Naples and his brother Wenceslaus maintaining with difficulty his throne in Bohemia, having been deposed in Germany. He was imprisoned by Ladislaus, but escaped, raised a large force and in 1403 succeeded in expelling Ladislaus and subduing the kingdom. In 1411 he was elected emperor of Germany and was crowned Holy Roman emperor at Aix-la-Chapelle in 1414. During the Council of Constance in 1414 he allowed John Huss to be put to death for heresy, an act which resulted in the Hussite War. Wenceslaus died in 1419, but it was not until 1431, when Sigismund signed the compact with the Council of Basel, that the Hussites would permit the acknowledgment of his succession to the Bohemian throne. He was crowned emperor in Milan in 1431, and his coronation was repeated in Rome in 1433. The Luxemburg dynasty became extinct at his death, as he was succeeded by his son-in-law, Albert II of Saxony. Consult Aschbach, J. G., 'Geschichte Kaiser Siegmunds' (4 vols. Hamburg 1845); Main, A., 'The Emperor Sigismund' (London 1903); Schiff, Otto, 'Kaiser Sigmunds italienische Politik' (Frankfort 1910); Windecke, E., 'Denkwürdigkeiten zur Geschichte des zeitalten Kaiser Sigmund's' (Berlin 1893).

SIGISMUND I, surnamed The Great, king of Poland: b. 1 Jan. 1467; d. Cracow, 1 April 1538. He was the youngest son of King Casimir IV, and in 1506 succeeded his brother Alexander on the throne of Poland. The war with the Russians, which was urged forward by the Lithuanian prince Michael Glinski, gave him employment throughout his whole reign. The peace of Poland was also disturbed by inroads of the Tartars and of the Wallachians. On the other hand Poland was increased by the addition of Masovia. By his toleration the Reformation spread in Poland, and Protestantism became the prevailing religion both in Grand Poland and Polish Prussia. Sigismund, after the death of his wife, Barbara Zapolika, married a daughter of the waywode of Transylvania and Bona Sforza of Milan. This marriage was the cause of many misfortunes to the country. The Italian soon secured for herself an influence in the government, sold the public offices and at last placed Piotr Kmita at the head of the administration, which acts contributed to destroy the popularity of the king. Under Sigismund the golden age of ancient Polish literature began.

SIGISMUND II, Augustus, king of Poland: b. 1 Aug. 1520; d. Knyszyn, 14 July 1572. He was son of Sigismund I, and was appointed king in 1529, in the lifetime of his father, and in 1544 obtained the government of Lithuania. His mother, Bona Sforza, allowed him to grow up in luxury and effeminacy that she might be able to continue her influence during the government of her son; but upon his accession he disappointed her expectations. When by the revival of ancient laws he proceeded firmly in curtailing the powers of the nobility they endeavored unsuccessfully to depose him. Bona, universally hated, finally quitted Poland with immense treasures for Italy, where she was poisoned by her paramour in 1557. Under Sigismund the Reformation made great progress in Poland, and many senators, landed proprietors, bishops and clergy exchanged the Roman Catholic faith for Protestantism. In 1563 Sigismund gave toleration to the different

religious parties, and in 1572, at the Diet of Warsaw, proclaimed universal religious freedom. With his death the Jagellon race became extinct. See POLAND.

SIGISMUND III, or **SIGISMUND VASA,** king of Poland and Sweden: b. 1566; d. Warsaw, 1632. He was the only son of John III, king of Sweden, and of the Polish princess Catharina, a sister of Augustus Sigismund II. After the death of Stephen Bathori he was invited, in 1587, to become king of Poland, and having sworn the Pacta Conventa was crowned at Cracow. He was a very zealous Catholic, and his principal aim was the extension of the Roman Catholic faith in Poland. On the death of his father, John III, in 1592, he set out for Sweden to take possession of the throne to which he had succeeded, and was crowned in 1594. On his return to Poland he was obliged to leave Sweden under the regency of his uncle who ultimately reigned over it as Charles IX. Sigismund's refusal to give up the Swedish crown, of which he became deprived, involved Poland in a disastrous war with Sweden, which lasted for 60 years. Consult Niemojewski, S., 'Mémoires' (Lemberg 1899); Niemcewicz, J. U., 'History of the Reign of Sigismund III' (Breslau 1836); 'Sveriges Historia' (Vol. III, Stockholm 1881); Rembowski, A., 'The Insurrection of Zebrzydowski' (Cracow 1893).

SIGL, zē'gl, **Georg,** mechanical inventor: b. Breitenfürth, Lower Austria, 1811; d. Vienna, 9 May 1887. He was in youth apprenticed to a locksmith and practised his trade in Bavaria, Württemberg and Switzerland. In 1832 he took employment in the rapid printing press factory of Helwig and Müller, and in 1837 introduced the manufacture of rapid printing presses into the hand press factory of Dingler in Zweibrück, and opened a branch factory of the same sort in Vienna, where he constructed the first rapid lithographic press (1851). Later he manufactured rotary presses, and applied himself to improving the locomotive and other machinery.

SIGMA XI (*Σπουδῶν Ξυνωνες*, "companions in zealous research"), a college honorary society for scientific students, founded at Cornell University in 1886 and now possessing chapters in 30 colleges and schools. It provides for scientific students a society similar to that of Phi Beta Kappa in literature. Its object is to provide meetings for the discussion of the work of its members, promotion of a fraternal feeling among them, the encouragement of original research in pure and applied science and to aid scientific progress by the publication of material dealing with its development and achievements. The membership includes resident professors and instructors, graduates and, in limited numbers, undergraduates who evidence unusual promise. Honorary membership is accorded scientists who have achieved important work in either pure or applied science. The badge or insignia is a gold watch pendant in the form of a monogram of the two letters of the Society. Annual conventions are held, each chapter sending three delegates who meet with the council of the Society. The Society was at first averse to extending its organization, but there are now 30 chapters, of which that at Yale University was established in 1895 and that at Columbia in 1915. The combined membership of the Society is about 10,000, of whom about 2,300 are active members. Since March 1913 the Society has published the *Sigma Xi Quarterly.* Consult Ward, H. B., 'Sigma Xi Quarter Century Record and History, 1886–1911' (1911).

SIGN LANGUAGES are vehicles of communication by gestures, principally employed by primitive peoples, such as the American Indians. They are of two kinds, the descriptive and the characteristic or indicative signs. Descriptive signs involve an account, more or less complete, of the appearance, qualities and uses of an object, or the circumstances of an event, for the purpose of description or explanation; and must, from their nature, be varied, like a painting, only by the point of view from which the objects are described, or the capacity and accuracy of the person that describes. The indicative signs, on the contrary, which are employed in common conversation, are usually mere abbreviations of these, involving a single striking feature of the person, or object, or event; as an elephant is indicated by its trunk, a flower by its fragrance or a town by a collection of roofs. The signs of persons are usually conventional, and derived from some feature, or mark, or habit but often from an accidental circumstance in dress, etc., which struck the deaf-mute on first seeing the person and is still referred to when it no longer exists. This form of expression, as developed in certain institutions for deaf-mutes, is of a character which those who value it least admit to surpass speech in the force with which it communicates the feelings and states of mind. Like painting (as Condillac observes) it has the immense advantage of presenting a group of ideas at once, which lose much of their force and beauty by being detailed in the successive words and artificial arrangements of written language. The eye, the hand, the whole body, speak simultaneously on one subject; the representation changes every moment, and these peculiarities, with the elliptical form of expression which is adopted in conversation, give a rapidity to communication by the sign language which, on common subjects among those familiar with it, surpasses that of speech. If we remark the new shades of meaning given to the same words by the varying attitude and general expression of the speaker, and the accuracy with which a nice observer will discover, in these signs, the thoughts, and feelings, and intentions, even of one who wishes to conceal them, we shall find reason to believe that they are capable of conveying the most delicate shades of thought. Generic and abstract terms, as their objects do not exist in nature, have no corresponding terms of equal clearness in the sign language; and the abbreviated manner in which we express relations by conjunctions, prepositions, relatives and inflections, can only be imitated by adopting similar conventional signs, which do not easily fall in with the idiom of the language. In these respects, therefore, the sign language lacks the algebraic brevity and accuracy which are found in artificial languages, and which render these so invaluable as mediums of thought and instruments of philosophical investigation; at

the same time it is capable of describing what is conveyed by these forms, with an accuracy at least as great as that of words by circumlocution and example. It is worthy of remark that the order of expression in the sign language is that which we term inverted—the subject before the quality, the object before the action and, generally, the thing modified before the modifier. This language, in its elements, is to be found among all nations and has ever been the medium of communication between voyagers and the natives of newly-discovered countries. It is employed by many savage tribes to supply the paucity of expression in their language, or to communicate with other tribes, as has been observed among the Indians of North America. It is known that among the Indians of the western regions of the United States there was an organized language employed between tribes who spoke different articulate languages. See also GESTURE.

SIGNALS, Railway. See BLOCK AND OTHER RAILWAY SIGNAL SYSTEMS.

SIGNALS AND SIGNALING. The word "signal" is defined in the dictionary as "a gesture, act, light, etc., serving to warn, direct, command or the like." It also connotes ways of communicating information according to prearranged systems or codes. In addition signaling implies that the use of spoken or written words is impracticable, disadvantageous or too slow. Technically speaking such methods of communication as the land telegraph, the telephone, the teletype, and other similar devices fall in the domain of signaling but are not so considered in common parlance. Radio telegraphy is however more likely to be thought of as signaling because it is one of the two important methods of making use of the International Code of signals.

Signaling goes back to remotest antiquity and is described in the earliest historical writings. Means for transmitting information rapidly to a distance have been developed by even the most primitive people. The American Indians, especially those west of the Mississippi River, were adept in the use of smoke signals. Sound signals made by beating drums are still used in tropical regions where dense vegetation interferes with the use of visual signals. The uncanny passage of news through the jungles of Africa by this method is an example.

Marine Signals.—Modern signaling has its roots in the communication needs of mariners. That the most ingenious signaling devices and the most elaborate signal codes are those used by mariners is not a matter of chance but of necessity. Normally ships at sea have no way of communicating with one another or with the shore except through the medium of signals. Visual, sound, and radio signals are as effective in bridging distance at sea as they are on land, but the mariner needs something more. He needs in addition a code to overcome the barrier of language that more often than not lies between him and those with whom he wishes to communicate. To this end and to secure other advantages associated with signaling an International Code of Signals has been adopted by the maritime nations of the world.

Organized signaling between naval ships as distinguished from merchant ships goes back several centuries but until the end of the 18th century the things that the admiral of a British fleet, for example, could say by signals to the ships under his command were few and there were no codes or signal books to facilitate and to speed up the process. Beginning with the early part of the 19th century codes of signals for the use of mariners in general, but intended especially for merchant ships, were published in various countries. Some of these were brought out by private enterprise. The code most used by American vessels at the height of the clipper ship era was one published in 1854 by Henry J. Rogers of Baltimore, Maryland. The first so-called International Code was drafted in 1855 by a committee set up by the British Board of Trade. It was published in book form in 1857. The book was adopted by most of the maritime nations and lasted for over 30 years when a revision was undertaken which was put into effect in 1897. This edition was given a very severe test during World War I because ships of all nations came into frequent contact with one another and had constantly to exchange messages relating to examination, mine fields, patrolling, and keeping position in convoys. Neither the code nor the instructions for its use stood the test as the system was not truly international. After World War I the British government proposed that the revision of the International Code be considered by the International Radiotelegraph Conference due to be held in Washington in 1927. This was done and a revised code was brought out in 1931. This revision fully met the requirements of World War II.

The *International Code of Signals* is contained in two volumes: Volume I—*Visual*, and Volume II—*Radio*. The principal methods of visual signaling are by flags, flashing lights and semaphore. The color plate which is part of this article shows the 26 International Code alphabet flags, 10 numeral pennants, 3 repeater pennants, and the code pennant used in making signals by the flag method. The flags are hoisted singly, or in combinations of two, three, or four alphabet flags but never more than four alphabet flags in a single group. The flags are seldom used to spell out words but practically always to convey the meaning assigned to the various combinations given in Volume I of the code book.

Single letters are used for messages that are either very urgent or are sent very frequently. The following are the single letter signals of the International Code:

A I am undergoing a speed trial
B I am taking in or discharging explosives
C Yes (affirmative)
D Keep clear of me, I am maneuvering with difficulty
E I am directing my course to starboard
F I am disabled. Communicate with me
G I require a pilot
H I have a pilot on board
I I am directing my course to port
J I am going to send a message by semaphore
K You should stop your vessel instantly
L You should stop. I have something important to communicate
M I have a doctor on board
N No (negative)

Semaphore alphabet, numbers, and special signals.

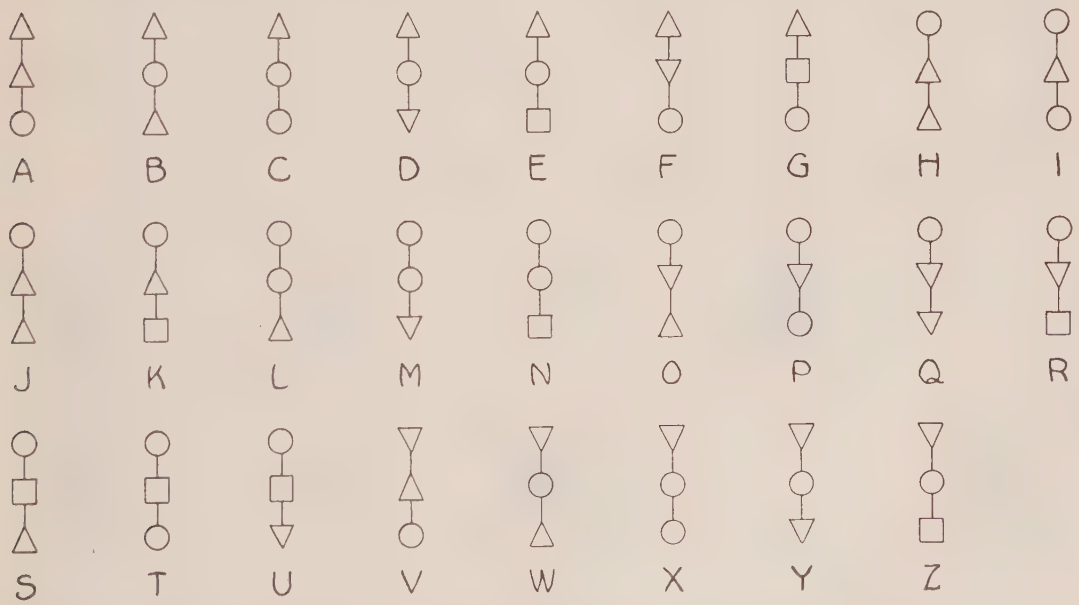
O Man overboard
P In harbor (Blue Peter). All persons are to repair on board as the vessel is about to proceed to sea. (Hoisted at the foremast head.) At sea—your lights are out, or burning badly
Q My vessel is healthy and I request free pratique
R The way is off my ship; you may feel your way past me
S My engines are going full speed astern
T Do not pass ahead of me
U You are standing into danger
V I require assistance
W I require medical assistance
X Stop carrying out your intentions and watch my signals
Y I am carrying mails
Z Used to address or call shore stations

A special code of single letter towing signals is also provided, some of which are the same as the above.

Two letter signals have been assigned to words, phrases or messages that follow next in importance. They consist mostly of distress and maneuvering signals with a few general signals of frequent use. Three letter signals are used for all other words, phrases and sentences not covered by one and two letter signals. Four letter signals, having "A" as the first letter, are used to designate the geographical places listed under the "Geographical Section" of Volume I of the *International Code of Signals.*

easy, but it was obviously impossible to anticipate all of the sentences and phrases that might be needed in actual practice. The single letter and two letter signals consist mostly of complete sentences. The three letter combinations consist of words and phrases so chosen that a message coded word for word in one language will be understood when decoded in any one of the others. One of the difficulties in compiling a multilingual code is that single words in one language often require several words in other languages to insure an adequate translation. Another difficulty is that such a code cannot take account of the difference in word arrangement to form sentences that exist between some of the languages and English. To meet these and other problems, many ships carry on board the English edition of the code as well as the edition in their own language.

For flag signaling the United States Navy uses the International alphabet flags and numeral pennants, and in addition has a set of numeral flags and special meaning flags of its own. Flag hoist signaling provides for the navy a rapid and accurate method of making tactical and informational signals of reasonable length. In general signals so made insure more uniform execution of maneuvers than if made by any other method. The limitations of the method are that it can be used only in the daytime and in clear weather. The United States Navy has its own signal books but the International Code is also always on hand for communicating with other than United States naval vessels.



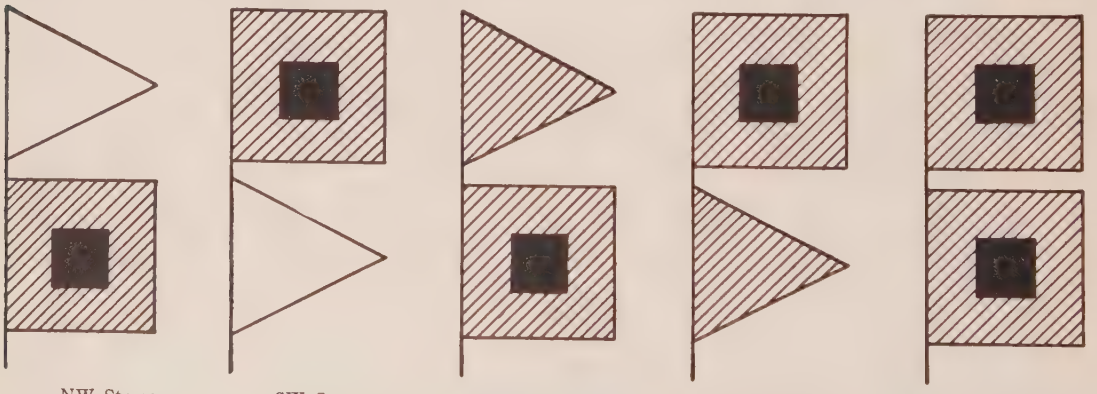
The International Code of signaling by cones, balls and drums, illustrated above, is now obsolete and is shown here only for its historical interest. The use of this system of distant signals was officially abandoned in 1930 by the International Radio Telegraph Conference held in Washington, D.C.

In order to facilitate the use of the code internationally, editions have been brought out in English, French, German, Italian, Japanese, Spanish, and Norwegian. English was used as the basic language in compiling the code and in writing the instructions for its use. Had it been possible to prepare a code consisting of complete sentences only, the problem of compilation in seven languages would have been comparatively

Storm Warnings.—The United States Weather Bureau displays flags as shown in the accompanying cuts (shading indicates red) to announce the approach of storms. A red pennant displayed alone indicates that while the winds may not reach a velocity sufficiently high to justify display of a regular storm warning, they will interfere with the safe operation of small craft, such as those engaged in fishing, towing, motor

boating, and yachting. A red flag with black center indicates that a storm of marked violence is expected. A pennant, either red or white, displayed with such a flag, arranged as shown in the illustration, indicates the direction from which the wind is expected to blow. A hurricane is announced by two red flags with black centers, one above the other. The hurricane warning at night consists of two red lights placed vertically with a white light between.

Flashing Light Signals.—The International Morse Alphabet is used for transmitting signals by flashing light, sound, and radio. In this code each letter and number is represented by a particular combination of dots and dashes. Taking the dot as a unit, a dash is equivalent to three units and the pause between two elements of a letter is equivalent to one unit. The mechanism for making flashing light signals is either an electric light which is turned off and on or of a steadily burning light which is alternately obscured and exposed by a shutter. The shutter method is used with searchlights and is suited to daylight as well as night signaling. The longest range visual signaling in daylight is in fact done with large searchlights. The make and break method is used with the various electric light systems such as the yard arm blinker, the hand flashlight and the blinker tube. The last mentioned is simply a light encased in a tube closed at one end. The tube is pointed in the direction of the receiver of the message and the light is turned off and on by a trigger operated switch. The blinker tube method is the least conspicuous of the flashing light systems and is especially adapted to darkened ship signaling, but its range is limited. Signaling by infra-red radiation, invisible to the naked eye, was developed during World War II. The signals are viewed through a receiver which converts the infra-red waves into visible light waves. The range of an infra-red source is reduced by adverse weather conditions to approximately the same degree as the range of white light of comparable intensity.



NW Storm SW Storm NE Storm SE Storm Hurricane

Semaphore.—In this system the letters of the alphabet and the numerals are represented by the position with respect to each other of the two arms as shown in the accompanying illustration. The alphabet so made is sometimes referred to as the changing angle alphabet. Mechanically operated arms mounted on towers for land signaling and on the bridge of ships for marine signaling were at one time in general use but the present practice is for the signalman to hold a flag in each hand and to form the angles representing the letters with the extended arms. Semaphore using the arms is a rapid method of signaling over short distances, speeds as high as 25 words per minute being readily attainable. In the United States Navy it is used at sea largely for messages between ships in formation. In port it is used, so far as distance permits, for all daytime administrative signaling between ships.

Rule of the Road Signals.—The most frequently used and universally understood signals are probably those connected with the observance of the so-called Rule of the Road at Sea. Their purpose is to prevent collisions and to provide a simple code for giving notice that a vessel is in distress. Masthead lights are prescribed as to kind and location to show whether vessels are underway and to give warning of limited maneuverability because of the work in which they may be engaged, such as fishing, dredging, towing, etc. Side lights are used to show which way the vessel is heading. Sound signals are prescribed for vessels in a fog, and for indicating their intention as to course in passing; also to give notice when the engines are backing. Distress signals consist of firing a gun or other explosive at short intervals, repeating the letters SOS by radio, displaying appropriate International Code signal flags, and sounding continuously any fog signal apparatus. At night in addition to the sound and radio signals, flares and rockets may be used.

Submarine Signals.—Sound signals can be produced, transmitted, and received underwater as they can in the air. The sound impulses are created in the water by an electrically driven oscillator mounted in the skin of the ship and are picked up on the receiving ship by a microphone installed in a tank having the hull plating of the ship for one of its sides. Thence the signals are transmitted to a head set worn by the operator or to electronic receiving and recording devices. This method is used to some extent for Morse alphabet communication between ships, particularly between submarines. The most important uses of underwater sound signals are however for detecting and tracking submarines and in the form of the fathometer for determining the depth of water. For these purposes the echo of the sound signal is used. The elapsed time between the sending of the impulse and the return of the echo from the bottom or from a submerged object such as a submarine is measured and converted automatically by the instrument into distance units which show up as illuminated figures

on a dial or recording device. In recent years under water sound signals have found extensive use in commercial fishing craft for locating schools of fish and shrimp colonies. The range of under water sound signaling does not normally exceed 3,500 yards and this is often considerably reduced by temperature and density gradients in the ambient water. However, under exceptionally favorable conditions much greater ranges are sometimes achieved.

Radiotelegraphy.—Limited range is the principle shortcoming of all of the foregoing signaling methods. Once at sea and over the horizon ships equipped only for visual and sound signaling remain out of touch with the world until they fall in with other ships or reach their destinations. The invention and development of radio telegraphy at the turn of the last century put an end to this limitation and brought about profound changes in the management of sea borne commerce, in the control by governments of their naval and distant military forces and in the safety of ships at sea.

We are here concerned only with radio as a signaling device. For this purpose it uses the Morse international alphabet code. There are many aspects of radio telegraphy which from the beginning required international agreement in order to avoid chaos in its use, and to stimulate its further development. One of these was the need for agreeing on an international code to parallel the code already adopted for visual and sound signaling. The radio code now in use after some earlier versions is the outcome of deliberations of the International Radiotelegraph Conference held in Washington in 1927. As mentioned above the visual code was also revised at this conference.

Although a large percentage of all radio traffic goes by Morse alphabet in plain language (much of it in English no matter what the language of the communicators), there are definite advantages in using a code especially a code that has seven different language editions so worked out that concise and unequivocal messages can be exchanged between persons who do not know the same language. The radio code was devised particularly to meet the needs of aviation because visual and sound signals can be used by aircraft to only a very limited extent. The radio telephone has largely displaced radiotelegraphy for short range aircraft communication, just as it has taken the place of submarine cable communication for many purposes. The telephone whether employing radio transmission or metallic circuits can hardly be called a signaling device as conversation is carried on directly and usually in plain language without the interposition of codes or the need for translation. The provision for scrambling radio telephone speech does however give it one of the characteristics of a signaling method in that this provision protects the user against eavesdropping.

There are numerous other applications of electronics to signaling which need only be mentioned here as they are covered in greater detail in articles on the subjects to be found elsewhere in these volumes. Time signals are broadcast at regular intervals from powerful radio stations as aids to air and sea navigation. Continuous signals are sent out by radio beacons to keep aircraft on their courses overland. Signaling systems at air fields assist aircraft in making blind landings. Radio compass bearings are transmitted to ships from stations along important coast lines. The Loran system of navigation is based on signals sent continuously from specially equipped shore stations which when picked up by appropriate receiving devices on ships or aircraft fix their geographical positions. Radar makes use of a rather narrow band of electromagnetic wave lengths which have the property of being reflected by solid objects. Such echo signals have been put to a great variety of uses.

Signaling in Land Warfare.—Until the invention and development of Morse's electromagnetic telegraph during the decade ending in about 1848 the use of signaling in land warfare had received little attention. Some use had been made of smoke beacons and semaphore and the heliograph but the galloping aide was the conventional method of transmitting orders and information to troops beyond the range of bugles, drums and the human voice. Forward looking military men recognized in the telegraph the means for controlling from distant headquarters the movements of armies and of their logistic support and of obtaining information from the front quickly. It was obvious that thereby a degree of coordination and timing could be brought about never found possible before. Three major wars in the decade and a half following Morse's invention, the Crimean War 1854–1856, the American Civil War 1861–1865, and the Prussian Campaign against Austria in 1866, provided testing laboratories for the further improvement of the telegraph and its collateral equipment for field use. All countries found it necessary to train special personnel for this service. In the case of the United States a Signal Corps was established coequal with the other specialized corps of the army. It is interesting that the first army aviators were Signal Corps officers and that army aviation came under the Signal Corps until a separate Air Corps was established. The significance of this is that in the early days of military aviation including the first months of World War I the airplane was looked upon as primarily an instrument of reconnaissance; the pilot making his report after returning from a mission. Shortly however spotting and reporting the fall of shot for the artillery was added. This led to the installation of radio in aircraft. Often also the need arose for isolated bodies of ground troops to make known their predicament and their position. This could be accomplished most easily by displaying coded ground signals to their own aircraft. The airplane thus became an important link in the signaling and communication systems of ground forces before it developed into a powerful weapon of offense and defense.

Radio Telephone.—The radio telephone to a great extent has taken the place of code signaling in ground and air warfare. When this instrument first appeared in the offing the armed services did everything possible to speed its development as it obviously was the answer to most of the shortcomings of other signaling and communication methods. Actually it is an extension of the senses of sight, hearing, and speech rather than a signaling method. It is however not altogether proof against the eavesdropper. But when used in conjunction with the motorcycle, radar, and the reconnaissance airplane, the radio telephone is capable of providing headquarters directing military operations with more complete information and at greater speed than was possible by former signaling methods.

Miscellaneous Signals.—Some other uses of signals are the very elaborate systems devised by the railroads for controlling traffic in terminals, and freight yards and the block systems for safeguarding trains against collision. In many small cities the location of fires is announced by whistle or other sound signals. Warnings of impending air attacks are given in the same way. The great development in the field of electronics brought about by World War II has vastly extended the use of signals in industry and transportation. See also LIFE SAVING SERVICE, THE UNITED STATES; BLOCK AND OTHER RAILWAY SIGNAL SYSTEMS; LORAN; RADAR.

Rear Admiral, United States Navy (Retired).

SIGNET, in England, one of the royal seals, used in sealing private letters and all such grants as pass the sovereign's hand by bill signed.

SIGNORELLI, sē-nyô-rĕl'lē, **Luca** (in full LUCA D'EGIDIO DI VENTURA DE'; also called LUCA DA CORTONA), Italian painter: b. Cortona, 1441; d. Arezzo, 1523. He began to distinguish himself about 1472, and painted until 1512, or perhaps later. He holds an important place in the history of art as the first who applied anatomical knowledge to painting, and thus became the precursor of Michelangelo. Signorelli's greatest works are the magnificent frescoes in the Chapel of the Madonna di San Brizio in the Cathedral of Orvieto. The series comprises the *History of Antichrist,* the *Resurrection of the Dead, Hell* and *Paradise.* It was begun by Fra Angelico about 1447, and finished by Signorelli between 1499 and 1504. These frescoes were studied by Canova, and by Michelangelo, who did not disdain to copy some of the figures for his *Last Judgment.* Among his other works the most worthy of mention are the *Madonna Enthroned,* the altarpiece of St. Onofrio in the Cathedral of Perugia; the *Adoration of the Magi,* now in the Louvre; the *Annunciation,* and a *Madonna,* at Volterra. Signorelli was a man of high character and attained municipal as well as artistic honors.

SIGNS AND SIGNBOARDS. The art of sign painting was known among the Greeks and Romans and specimens of ancient signs have been found at Pompeii and Herculaneum, sometimes painted, but more often carved. A bush was the sign of many taverns as late as the reign of James I. During the Middle Ages every trade had its emblem, some of which have survived, as the chemist's pestle and mortar, the pawnbroker's three balls and the barber's pole. Besides these trade emblems, every individual trader might have his own special device: Southey's father, a Bristol linen-draper, for his chose a hare. During the 16th and 17th centimes painted, but more often carved. A bush was They were suspended either from projecting metal work from a post or an obelisk, or from a sort of miniature triumphal archway, and sometimes cost great sums. These creaking and ponderous signboards proved a source of annoyance, sometimes of positive danger, as when in 1718 one in Fleet Street, London, dragged down a house front and killed in its fall four persons. So in 1762–1770, under act of Parliament, the London signboards were either wholly removed or at least affixed to the fronts of the houses; and this example was gradually followed throughout the kingdom, though here and there signposts linger or have been restored, even in London. One of the oldest and most interesting signs still existing is the "Red Lion" at Martlesham, Suffolk, England, for it was the figurehead of one of the Dutch fleet defeated off Southwold in 1672; but the history even of vanished signboards has no slight interest. A good many signboards have been painted by great artists, Holbein, Correggio, Paul Potter, Hogarth, Wilson, Morland, David Cox, "Old" Crome, Sam Bough and Sir J. E. Millais (some of which are still extant). In the United States many old and picturesque signs are still to be found in Eastern cities, particularly in Atlantic coast towns. Modern signs are made mostly of metal and are illuminated. Elaborate signboards indicating the trade practiced by the owner were necessary in an age when very few could read. With the spread of education among the masses they have become unnecessary. Lettered announcements now suffice to call attention to the wares within.

SIGONIO, sē-gô'nyô, **Carlo** (Lat. CAROLUS SIGONIUS), Italian humanist: b. Modena, c.1524; d. near Modena, August 1584. After studying at Pavia and Bologna he was elected professor of Greek at Modena in 1545. Accepting a professorship at Venice in 1552, he exchanged it for the chair of eloquence at Padua in 1560. His treatise *De nominibus Romanorum,* in which he corrected errors in a similar work by Robertelli, a colleague, initiated a violent dispute between them and influenced his acceptance of a call to Bologna in 1563. The publication at Venice in 1583 of a work, allegedly Cicero's *Consolatio,* written to dull his grief over the death of his daughter Tullia, occasioned a final violent dispute. Sigonio argued that, if not genuine, it was at least worthy of Cicero; his adversaries ridiculed the idea and accused him of having written it himself as a hoax. The forger is unknown.

SIGOURNEY, sĭg'ĕr-nĭ, **Lydia Howard Huntley,** American author: b. Norwich, Conn., Sept. 1, 1791; d. Hartford, Conn., June 10, 1865. She received a good education, showed considerable facility in rhyme at an early age and many of her pieces were published in the periodicals of the day. For some time before her marriage to Charles Sigourney in 1819, she had been engaged in teaching in schools for young ladies. In 1815 she published *Moral Pieces in Prose and Verse,* which was quickly followed by other works, most of which enjoyed great popularity. Among her principal poems are *Traits of the Aborigines of America* (1822); *Pocahontas* (1841); *Scenes in My Native Land* (1844); *Voice of Flowers* (1845). Her prose works are mainly biographical, historical, didactic, and epistolary.

In 1840 she visited Europe, and in 1842 gave some reminiscences of the tour in a volume entitled *Pleasant Memories of Pleasant Lands.* She has been called the "American Hemans," and certainly rivals her English prototype in copiousness, having, by her own computation, written 46 works (in whole or in part), and more than 2,000 contributions to about 300 periodicals.

SIGSBEE, Charles Dwight, American naval officer: b. Albany, N. Y., Jan. 16, 1845; d. July 19, 1923. Appointed to the United States Naval Academy in 1859; was graduated in

1863, was made ensign in that year and for his first two years of service was attached to the *Monongahela* and the *Brooklyn* of the West Gulf squadron. He took part in the bombardments of, and attack on, Fort Fisher, and in the battle of Mobile Bay. In 1868 he attained the grade of lieutenant-commander. Thereafter he was employed in various duties, being at different times with the Asiatic and North Atlantic squadrons; stationed at the Naval Academy 1869–70; in the hydrographic office (1873–74); and commander of the coast-survey steamer *Blake* employed in deep-sea exploration for the government. The chief portion of the outfit of the *Blake* consisted of inventions or adaptations by Sigsbee, and in recognition of these he received a gold medal at the London International Fisheries Exhibition and the decoration of the Red Eagle of Prussia from Emperor William I. Promoted commander in 1882, he was successively on duty at the academy (1882–85); commander of the practice-ship *Dale* (1883–84), and of the *Kearsarge* on the European station (1885–86); and on shore duty (1887–90). In 1890–92 he commanded the training-ship *Portsmouth*, in 1893 was made chief of the hydrographic office, was made captain 21 March 1897 and on 10 April subsequent assigned to the command of the *Maine*. The *Maine* was designed at the Navy Department, built at the New York navy yard, commissioned 17 Sept. 1895 and the most powerful second-class battleship in the United States navy. In January 1898 the vessel was ordered to the port of Havana, Cuba, arriving there 25 January. There it was met by an official Spanish pilot and moored to a mooring-buoy chosen by him. At 9.40 o'clock on the evening of 15 February the *Maine* was destroyed by an explosion in which the entire forward part of the ship was utterly wrecked. Two officers and 264 of the crew perished. The United States court of inquiry appointed to inquire into the catastrophe found that the vessel was destroyed by the explosion of a submarine mine, and that no evidence was obtainable fixing the blame. A Spanish court making a simultaneous investigation reported that the disaster was caused by an internal explosion. It was very generally believed, however, in the United States that the loss of the ship was in some way due to Spanish initiative. Therefore, says Sigsbee in his own narrative, "although the war which followed was not founded on the destruction of the *Maine* as a political cause, that disaster was the pivotal event of the conflict." Sigsbee's wise dispatches at the time did much to suspend any popular demand for immediate reprisals, while his expert knowledge was of great value to the court of inquiry. He rendered distinguished service during the Spanish-American War as commander of the converted liner *Saint Paul*, with which on 24 May 1898 he captured the collier *Restormel*, securing Cervera's coal supply, and 22 June defeated the cruiser *Isabella II* and destroyer *Terror* off San Juan, Porto Rico. Subsequently he was ordered to command the *Texas*, in 1900–02 was chief officer of naval intelligence, in 1903 was made commander of the navy yard at League Island, Pa., and promoted rear-admiral. In 1904–05 he was commander of the South Atlantic squadron, and in 1905–06 of the second division of the North Atlantic fleet. He retired 16 Jan. 1907. He published 'Deep Sea Soundings and Dredging' (1880), and 'The *Maine*: An Account of Her Destruction in Havana Harbor' (1899).

SIGURD, zē'goord, or **SIGURDE**, a name famous in Scandinavian mythology. According to the legend Sigurd, the Siegfried of the Nibelungenlied, is the posthumous son of Sigmund, son of Volsung, a descendant of Odin; is born in the palace of Hialprek, king of Denmark, and grows up into splendid manhood. With his good sword Gram, which had once been wielded by Odin, he slays the dragon, Fafnir, and obtains the golden treasure which it guarded; by eating the monster's heart he is endowed with a wisdom which enables him to understand the songs of the birds. Riding off with his spoil he strikes through a lonely heath, in the midst of which is a volume of flame, surrounding a house in which a fair maiden Brenhyldr (Brunhild in the Nibelungenlied), daughter of Atli, lay asleep, never to be wakened until there came a hero brave enough to ride through the fierce flame. Sigurd enters and wakes up Brenhyldr, to whom he plights his troth, and then rides to the palace of Giuki the Niblung, who wishes Sigurd to marry his daughter Gudrun (Chriemhild). Gudrun's mother gives Sigurd a potion which causes him to forget Brenhyldr, and he marries Gudrun. Her brother Gunnar (Gunther), having determined to marry Brenhyldr, tries vainly to ride through the flames, and so his mother by her magic arts made Sigurd change shapes and arms with Gunnar, and so rescue Brenhyldr. On the bridal bed Sigurd places his sword between himself and Brenhyldr, and the following morning he resumes his shape, and hands her over to Gunnar. No sooner is this done than the power of the elixir passes off, and he sees when too late that he has betrayed his first love. After the lapse of years Brenhyldr is told that she was rescued from the flames by Sigurd and not by Gunnar, as she thought; and her love for the hero gives way to wrath and thoughts of vengeance. She urges Gunnar and his brothers to slay him, but as they had already taken an oath not to hurt him, they refuse. They, however, incite their half-brother to do the deed, and Sigurd is killed as he lay sleeping. The death of the hero revives all the love of Brenhyldr, and lying down by his side with the sword Gram between them, she dies broken-hearted on his funeral pile. Consult Boer, R. C., 'Untersuchungen über den Ursprung und die Enwicklung der Nibelungensage' (Halle 1906); Abeling, T., 'Nibelungenlied' (1907); Lichtenberger, H., 'Le poeme et le légende des Nibelungen' (Paris 1891); Paul, H., 'Grundriss der germanischen Philologie' (Vol. III, Strassburg 1900).

SIGURD SLEMBE, slĕm'bĕ', a trilogy by Björnstjerne Björnson, translated by W. M. Payne. This splendid sagadrama, so deeply impressive and so typically characteristic of Björnson, was planned by him already in 1858, when he was manager of the National Theatre in Bergen, but not completed until the author's stay in Rome in 1862. The author made a most thorough preparation for this work. Not only did he digest all that is to be found in the sagas about this unrecognized illegitimate son of Magnus Barefoot, king of Norway, but he

followed his hero in all his travels and adventures around in Europe in the early part of the 12th century. We find the whole spirit of the Middle Ages at the time of the Crusades in the very action, in the psychological exposition, and in the tragic solution. *Sigurd Slembe* is the tragedy of the man whose great gifts and talents qualified him for leadership, but of whom his own country would not make use—a theme which appealed to Björnson especially at the time when the drama was written. The ethical conflict is the same that the author treated in some of his earlier novels and his saga dramas. According to one of Björnson's letters, it is the conflict, in a man highly gifted by nature, between the craving for self-assertion and the duty to submit one's powers to the demands of a higher and nobler aim. In the first section of the trilogy, *Sigurd's First Flight,* the hero is presented to us, a powerful, handsome youth, full of energy and ambition. But he has no family name. In the opening scene he forces from his mother the confession of the name of his father. The poor woman at last reveals that King Magnus was her lover. At last he knows from what race he comes. He breaks away to seek adventures, to make a name and to return to claim the throne of Norway.

In *Sigurd's Second Flight* we find the hero on the coast of the old Norwegian colony Caithness, Scotland, at the court of the exiled Earl Harold of Orkney. This sickly young man has no ambition and asks no more than to be at rest among his dreams. But his life is tortured by the wranglings of his mother and her violent and intriguing sister. The two women seek the aid of the magnificent Norwegian who has arrived in their palace, nobody knows whence. An orphan niece, Audhild, one of Björnson's finest female creations, falls in love with Sigurd. The young man is eminently successful in his campaign against Orkney. The earl, however, commits suicide and Sigurd rejects the crown which now lies at his hand and passes out to sea again. He tears himself from the arms of Audhild in a scene of extraordinary beauty and passion.

Sigurd's Return is the closing play. King Harold Gille, Sigurd's half brother, is with his court in Bergen. Our hero returns with the same hopes and illusions as when he left. Again, fate is against him. Two of the scenes especially are among the finest ever written by Björnson—the scene between Sigurd and the Finn girl, and Sigurd's sublime soliloquy: "The Danes desert me! The battle is lost! Here and no further!"

Failure confronts him as the result of all his toil. All avenues of escape are closed upon him. As he stands face to face with the ruin of the edifice he so nearly succeeded in erecting, all events of his past life come before him. He sees life in its true aspect. All worldly hopes being broken, Sigurd leans his weary head against the bosom of his aged mother while listening to the song of the Crusaders:

> Fair is the earth,
> Fair is God's heaven,
> Fair is the pilgrim-path of the soul
> Singing we go
> Through the fair realms of earth
> Seeking the way to our heavenly goal.

The second section of Björnson's trilogy was performed at Chicago in 1908. Johan Svendsen's *Sigurd Slembe* is a musical illustration of the drama.

SIKANG, shē'käng', province, China, in the south, comprising part of the Tibetan high plateau and the former southwest section of Szechwan. Sikang is sparsely populated (20 inhabitants per square mile). It is traversed by branches of the Kumlun and Himalaya Mountains, which, unlike most Chinese ranges, run north and south instead of east and west; and along them flow the headwaters of the Yangtze, Mekong, and Salween rivers. Sikang has been called the paradise of new China; but transportation has been exceedingly difficult. Before the highways were built from Szechwan it was almost inaccessible. In 1938 it was enlarged at Szechwan's expense, with several of the latter's cities included in the Sikang boundaries, among them Sichang and Yaan (capital of Sikang in 1950). A provincial government was established in 1939. During the Sino-Japanese War (1937–1945), when new methods of agriculture and modern industries were introduced, this wild virgin land became an important part of free China. There is considerable coal, iron, gold, and salt, and nickel and magnesium have been discovered. But the majority of the people, including Chinese, Tibetans, and tribesmen, engage in farming and animal husbandry. The main agricultural products are rice, millet, potatoes, and wheat. To improve agriculture two canals were built in southeast Sikang in 1944. Area 90,000 square miles; pop. (1952 est.) 2,000,000.

SIKESTON, sīks'tŭn, city, Missouri; in Scott County; altitude 330 feet. It is 30 miles south of Cape Girardeau, on the St. Louis-San Francisco and the Missouri Pacific railroads. It is a cotton center, with compresses, gins, and cottonseed oil plants. It was platted in 1860, and incorporated in 1874. The government is administered by mayor and council. Pop. (1950) 11,640.

SIKHS, sēks (Sanskrit, *S'ishya,* disciple), the name of a religious community in the Punjab, North India, which, in course of time, has become the designation of a people. There are two classes of Sikhs—Sahijdhari, and Kesadhari. The Sahijdhari Sikhs do not accept *pahul,* or baptism by the sword, which implies a ritual in which a two-edged sword is instrumental. The Kesadhari baptized Sikhs dress differently and wind their long hair around a short dagger which serves as a comb. From the Sikhs of today come some of the finest fighting men in the world. The Sikh regiments of the Indian Army were highly esteemed and respected by the British.

History of Sikhs and Sikhism.—The Sikh religion, which enjoins abstinence from tobacco and wine, was founded by Nanak (1469–1539), first of the great Sikh gurus. He was a humanitarian who aimed at combining Hindus and Moslems into one brotherhood. Nanak was a proponent of monotheism, an advocate of perfection and spiritual peace, and a profound thinker far in advance of his time. He abolished caste distinctions, sought to introduce simplicity of faith and purity of morals, and to induce Hindus and Moslems to live in harmony.

The cardinal principles of Sikhism somewhat resemble those of Christianity from which it departs, with other dissemblances, in its belief in transmigration—the passing of the soul at death into another body or successive bodies. Consonant with this, the Sikhs believed that the soul of Nanak lived again in his successors.

Nanak was succeeded by Guru Angrad (1539–1552) who, during his ministry, carried forward the gentle teachings of his preceptor. This pattern was generally observed by the two succeeding gurus, namely: Amar Das (1552–1574) who also discouraged the practice of suttee, the voluntary cremation of a living widow on the funeral pyre of her deceased husband; and Ram Das (1574–1581) who founded the golden temple of Amritsar which to this day remains the center of worship of the Sikhs.

Guru Arjan (1581–1606), the fifth guru, compiled the Sikh's Bible known as the *Adigranth,* which embodies the teachings of Nanak and his successors; of the saints who preceded him; and also perceptive Mohammedan verses. Accused of introducing a new divinity, Arjan was absolved by Akbar, the tolerant Moslem emperor of that time, but was later martyred by Jahangir, Akbar's successor. In consequence, under Mohammedan persecution, the hitherto mild religious Sikhs developed into a militant people in revolt against their Mohammedan rulers.

Har Govind (1606–1645), sixth guru, was a military as well as a spiritual leader. He founded the Sikh army which first challenged the Mogul authorities. He encouraged his followers to abandon vegetarianism, and through that to develop the superior physique that characterizes the Sikhs of today. Their warlike activities were continued against Shah Jahan, successor to Jahangir, whose troops they engaged and defeated. Guru Har Rai (1645–1661), who continued resistance to Islam, was succeeded by Har Krishan (1661–1664) whose short tenure of guru-ship was comparatively uneventful. The next guru, Teg Bahadur (1664–1675), was executed by Aurangzeb, third son of Shah Jahan, for refusing to embrace Mohammedanism.

Guru Govind Singh (1675–1708), the tenth and the most powerful of the Sikh gurus, developed a military regime during which the Sikhs became paramount in northwest India. He repudiated the caste system and ordained that all who would enlist under his banner might become Sikhs through *pahul,* the baptismal ceremonies instituted by him. He adhered to the teachings of Nanak, maintaining that God could be found only in humility and sincerity and wrote the second volume of the scriptures.

The Sikhs became politically independent as a confederacy in 1764, and Sikhism reached its zenith under Ranjit Singh (1780–1839) called "the Lion of the Punjab." He consolidated the federated states into one large state under his rule in 1805. The British power in India kept peace as long as he lived, but after his death wars broke out with the British. There were two such wars, the first in 1845. The struggle lasted with varying fortune and intervals of temporary submission on the part of the Sikhs. The second war broke out in 1848 and ended in the decisive battle of Feb. 21, 1849, when the Sikh power was broken and their territory was annexed to British India. With the outbreak of the Indian Mutiny (1857–1858) the Sikhs assisted materially in suppressing the revolt. It is claimed that their loyalty and valor saved India for the British. Ritualistic observance of Sikhism has abated somewhat, and although all Sikhs hold the *Adigranth* in reverence, the ordinances of Govind Singh are less strictly observed. Many Sikhs of today are almost indistinguishable from Hindus. Their total number is estimated to be around six million. See also INDIA—*Religion and Philosophy.*

SIKKIM, sĭk'ĭm, state, India, situated in the eastern Himalayas between Nepal and Bhutan, and between Tibet and Bengal; area 2,745 square miles. About 50 per cent of its population are Hindus and 25 per cent are Buddhists, and there are a few Christians. It forms part of the south slope of the Himalayas and ranges in altitude from 18,000 feet in the north to 1,000 feet in the south. Its extreme length from north to south is 70 miles, and its extreme breadth 50 miles. The climate is accordingly varied, ranging from tropical to alpine. Formerly most of the area was covered with forest, but the greater part below 5,000 feet has in recent years been cleared and cultivated. The chief products are maize and rice, oranges, apples, and woolen cloth. A few copper mines are worked. The mountain roads are good, and the route of Indian trade with central Tibet passes through the state.

In 1890 a treaty was signed by the viceroy of India and the Chinese representative, by which the British protectorate over Sikkim was recognized by China. The maharaja, after having declined to comply with the conditions, lived for some time under surveillance in British India, and in 1895 was allowed to return to Sikkim. The maharaja and the members of the council carried on the administration, with the assistance of the British political officer stationed at Gangtok. Sikkim became independent in 1947; in 1949–1950 responsibility for its administration was assumed by India.

The inhabitants are Bhutias, Lepchas, and Nepalese, the last named being now the most numerous. Principal towns are Gangtok, the capital, Rhenok, Rangpo, Pakyong, Lachen and Lachung. Pop. (1951) 135,646.

SIKORSKY, sĭ-kôr'skĭ, **Igor Ivan,** Russian-American aeronautical engineer: b. Kiev, Russia, May 25, 1889. A graduate of the Naval College, St. Petersburg, in 1906, and of Kiev's Polytechnic Institute two years later, he attempted to build a helicopter of his own design (1909). He made world records with a plane of his design in 1911, and in 1912 was chief engineer for an aeroplane construction company. He made a fortune designing Russian war planes in World War I. A White Russian, he fled to the United States after the revolution, became an American citizen (1928), and achieved new international celebrity as builder of American clipper ships, helicopters, and patrol bombers. In 1940 he produced the US-300, the first single main rotor helicopter in the world.

SIKSIKA, sĭk'sĭ-kà (BLACKFEET, by which name they are popularly known), an important tribe and group of allied, Alonquian-speaking Indian tribes of the North American plains, comprising the Siksika proper, the Kainah or Bloods, and the Piegan. The Siksika proper, or North Blackfeet, now live on a reservation near Gleichen, Alberta, Canada See also BLACKFEET INDIANS.

SILAGE, sī'lĭj, or **ENSILAGE,** is moist forage preserved in a succulent state by the ex-

clusion of air whereby it undergoes certain changes. It holds an important place in the feeding of livestock. Silage is generally stored in silos built of wood, tile, brick, stone, concrete, or steel. (See also SILO.)

This method of preserving feed was known for centuries in northern Europe. It became well known there about the middle of the 19th century. It was introduced into the United States in 1875 by Dr. Manly Miles of Michigan, and in 1876 by F. Morris of Maryland. Silage saves feed that otherwise would become inedible if dry or damaged by rain. It is palatable and has high content of carotene. It facilitates early clearance of ground to permit another crop, and ends the hazard of fire from spontaneous ignition of inadequately cured hay. Although silage is an easy form in which to feed forage to livestock, most silage has a low minerals and protein content, and is not suitable for use as a ration.

Conversion of Fodder into Silage.—In the silo the crop temperature rises until all the air in the interstices of the silage is exhausted. The quantity of air governs the rise in temperature which should not exceed 100°F. This maximum temperature is reached within a week. Thereafter, the silage cools slowly and steadily. Persistence of high temperatures indicates the ingress of air. If continued, this will cause the silage to become moldy. High temperature is evidence of a high rate of oxidation which impairs the quality of the silage.

Chemical Changes.—Various chemical changes take place during silo fermentation such as the conversion of sugars, starches, etc., into lactic, acetic, and other acids. After chopping, the plant cells of fresh green crops continue to take in oxygen from the air and to give off carbon dioxide which replaces the oxygen in the air. Provided that there is no more ingression of air the silage should keep indefinitely without molding or rotting. Crops with a low content of protein and calcium, such as corn, sorghums, and small cereal grains, when siloed alone or with not more than an equal weight of legumes, will develop enough acid to make them good silage. Crops with a high content of protein and calcium, such as the legumes or immature grasses, should have molasses or acid added, or should be wilted. Grasses harvested at the usual hay-making stage, provided they are not wet with dew or rain, need no special treatment. If wet, molasses should be added, or the excess moisture evaporated. A certain spoilage occurs that cannot be avoided, namely: that which occurs at the top of the silage. Tight sides and careful sealing around the doors of tower silos should prevent further spoiling.

Crops Suitable for Silage.—Corn is the most common silage crop wherever it can be grown successfully. Sorghums are suitable for silage and all legumes, including alfalfa, clovers, cowpeas, soybeans, lespedezas, and others even though they differ widely in physical characteristics, in chemical composition, and in yield, as well as palatability. Vines from pea-canning factories as well as corn-canning refuse, beet tops and crowns make silage of fair quality. In some localities sunflowers yield a much greater tonnage than corn. Beet pulp, apple pomace, wet brewers' grain, sugarcane, Napier grass, and weeds of various kinds are occasionally used for silage with fair success. Various crops suitable for silage need various forms of special treatment based on experience and scientific knowledge regarding moisture content, seepage, preservatives, and fermentation.

Silage Cutting.—Most silage is cut into pieces not over half an inch long; but all hay and small grain crops should be cut as fine as possible. Field-chopping, a method of silo filling now in vogue, although costly, is the easiest known. The standing corn is both harvested and chopped by a machine drawn by a tractor and operated by power from the tractor. The cut corn is mechanically delivered to a wagon box drawn alongside. Hauled to the silo, the cut is pushed off into a blower which elevates it into the silo.

Composition of Silage.—In general the chemical composition and nutritive value of silage are similar to that of the green crop from which it is made. The composition and digestible nutrients of certain forages—green, as silage, and dried, are indicated in the following table:

Forage crop	Composition of the forage: Moisture	Ash	Crude protein	Ether extract (fat)	Crude fiber	Nitrogen-free extract (sugars, starches, etc.)	Digestible crude protein in the forage	Total digestible nutrients in the forage	Total digestible nutrients in the dry matter
	Per cent	*Per cent*	*Per cent*	*Per cent*	*Per cent*	*Per cent*	*Per cent*	*Per cent*	*Per cent*
Alfalfa, in bloom, green	77.2	1.8	3.2	0.6	7.8	9.4	2.4	12.9	56.7
Alfalfa silage	68.9	2.7	5.7	1.0	8.8	12.9	4.0	18.8	60.6

Sorgo, green	77.3	1.3	1.5	1.0	6.2	12.7	.6	15.3	67.2
Sorgo, silage	74.7	1.4	1.6	1.0	6.9	14.4	.4	15.3	60.5
Sorgo fodder, dry	11.6	6.0	5.3	2.4	26.0	48.7	3.3	58.2	65.8

Compiled in the Division of Animal Nutrition, Bureau of Animal Industry.

Feed Value of Silage.—Silage has a feeding value 30 to 40 per cent as much as that of good hay. Only rarely is it used to the exclusion of hay, straw, or stover. Its outstanding characacteristics are its palatability, its consumption without waste, and its carotene content which is valuable to supplement grain and low-quality hay in the ration. Corn, sorghum, small grain, or grass silage contain insufficient protein and mineral matter for growth and milk production; they must be supplemented with some feeds to supply these deficiencies.

SILAGE IN CANADA

Records indicate that silage production in Canada goes back about 75 years. Corn was probably the first crop grown for silage and it is still the most popular in areas where it grows successfully. Under conditions too cool for good growth of corn, sunflowers have been used for silage. Yields are usually better than those of corn. While sunflower silage is less palatable than corn silage, cattle soon become accustomed to it.

In recent years there has been a substantial increase in the amount of grass and legume silage made in Canada. This has developed not at the expense of corn but rather as an alternative to hay in areas where grasses and legumes grow luxuriantly, but where weather conditions make it difficult to cure hay. Added impetus has been given by the popularity of the so-called horizontal silo, constructed above ground with wooden side walls. Compared with the conventional tower silo, the horizontal silo is much cheaper to build, can be filled and packed easily by mechanical means, and is adapted to self feeding by using racks at both ends. Spoilage losses are about the same as with tower silos.

The common grasses and legumes grown for hay are all being ensiled successfully alone or in various combinations, with and without the addition of preservatives such as molasses. Mechanized equipment enables farmers to handle large acreages with relatively little labor. In some areas grass silage production has increased more than twenty-fold in the past few years.

SILAO, sē-lä'ō, town, Mexico, in the state of Guanajuato, situated on the Mexican Central Railroad, 15 miles southwest of Guanajuato. It is at the junction of the branch line to the state capital. Situated at the base of the Cerro del Cubilete, it borders a rich farming area. There are cotton and woolen manufactures. A few miles distant are the hot springs, Aguas Terminales de Comanjilla. Founded in 1537, Silao has 18,463 inhabitants (1950).

SILAS MARNER, a brief novel written by George Eliot (Mary Ann Evans) in 1861, has always been one of the most popular as it is among the greatest of its author's works. The scene of the story is laid in the typical English village of Ravelow, at a time "when the spinning wheels hummed busily in the farmhouses." Against a picturesque and realistic background of rural life and custom George Eliot has set the strange and alien figure of the weaver, Silas Marner, who has come hither as an outcast from a narrow religious community in the city, where he has been unjustly convicted of robbery. Utterly broken in spirit, bankrupt of his simple faith, and cut off from all kindly human interests he becomes a miser, cherishing the ever-growing heap of his earnings at the loom as the sole object of his starved affections. When his gold is stolen by the vicious Dunstan Cass, younger son of the village squire, his life is left utterly barren and he becomes practically insane. At this crisis the abandoned wife of Godfrey Cass, Dunstan's elder brother, perishes in the snow before Marner's hut, and his child, Eppie, is found by Marner and welcomed as a providential gift sent to replace his stolen gold. The theme of the novel is the transformation in Marner's life, the restoration to his simple and affectionate soul which comes with this substitution of a human love, demanding care and sacrifice for the miser's perverted love of gold. Interwoven with the story of Silas is that of Godfrey Cass, the good-hearted but weak and badly brought up father of Eppie, who pays for his unwillingness to accept the consequences of his unworthy marriage, by seeing Eppie, now grown to womanhood, adhere to her foster-father even when Godfrey and his second wife, Nancy, at last tell her the truth about her parentage and would gladly welcome her to their childless home.

The story is as beautiful as it is significant. The variety of the characterization, the consummate handling of the narrative, and the profound moral insight of the author make this novel an unquestioned masterpiece of 19th century English fiction.

James H. Hanford.

SILAY, sē–lī', municipality, Philippine Islands, in Negros Occidental Province, on Guimaras Strait, 10 miles north of Bacolod. It is a large and prosperous town open to coasting trade, and is a telegraph and military station. Pop. (1948) 39,483.

SILCHESTER, sĭl'chĕs-tẽr, village, England, in Hampshire, seven miles north of Basingstoke, of special archaeological interest. Here are the ruins of Caer Segeint, or Calleva Atrebatum, a Roman town, the main features of which are an amphitheater, and the city walls, 2,760 yards long. The foundations of a basilica, forum, baths, and a temple have also been excavated, and rings, coins, seals, broken pottery in abundance have been found near the surface. Antiquarians have given the place much study. Excavations were begun by Joyce in 1864 but it was not until 1889, when the Society of Antiquaries took up the work, that the excavations were systematically carried out. By 1909 nearly all the ancient town had been uncovered, disclosing very many interesting remains. All portable objects now repose in the Reading Museum.

SILENE, sī-lē'nê, a large, widely distributed genus of the pink family (Caryophyllaceae), having opposite leaves, and five-merous flowers, with a more or less inflated calyx. The silenes are either annual or perennial and of varying habit and inflorescence. Many species are viscid pubescent, as *Silene virginica, S. caroliniana,* and *S. viscosa,* the last the catchfly, which is carnivorous to a slight degree and holds its victims by its stickiness. In general, however, the viscid stems prevent crawling insects, such as ants, from stealing honey and both common and generic names refer to this characteristic. *Silene nutans* and *S. noctiflora* are now naturalized in America and are faded and unattract-

ive in the daytime, but are in full bloom, with starry white petals at night, attracting night-flying insects by their fragrance. Another naturalized silene, found at the borders of fields, is the *S. vulgaris,* a glaucous tall plant, known as bladder campion, cowbells, behen, and spattling or frothy poppy. The first two names refer to the inflated calyx, which is much more conspicuous than the white notched petals protruding from the top, and in fruit is nearly globose, nodding in cymose panicles. It is of papery texture, tinted pale green flushed with rose and is reticulated with delicate veinings. It is said that English peasants have eaten its young shoots, tasting like green peas, instead of asparagus. The moss-campion (*S. acaulis*), a tufted perennial covered with reddish purple flowers, is common to Arctic regions and mountains; the sweet-william catchfly (*S. armeria*), with rose-colored flowers; and the fire pink (*S. virginica*), whose crimson flowers blaze in southern dry woods, are all cultivated, to which the northern wild pink (*S. caroliniana*) might well be added, as it has many rose-colored or white flowers in very early spring.

SILENT CHAIN, an improved form of link-belting consisting of a broad band of metal links the ends of which project inward of the belt circuit forming cog-shaped teeth which engage in a broad-faced toothed gear wheel. This chain belt has the advantage of working perfectly where the pulley shafts are necessarily close together, and are especially adaptable in the transmissions in automobile machinery. They have the additional advantage of being practically noiseless. See Power Transmission.

SILENT PARTNER, called at various times and places a dormant, sleeping or special partner. In commercial phraseology a member of a firm or corporation whose name does not appear publicly in the concern, but who shares the responsibilities and liabilities of the organization. Generally a partner of this sort takes no active part in the management of the business, outside of giving monetary support or receiving his portion of the profits. See Partnership.

SILENUS, sī-lēn'nŭs, represented in ancient mythology as the mentor and companion of Bacchus, the god of wine. Silenus, according to the legend, was generally drunk himself. He is sometimes represented as treading out grapes and other times as riding on an ass with the infant Bacchus in his arms. Various legends about him were current in antiquity especially in Asia Minor, where his worship first took concrete form. Consult 'Dictionary of Greek and Roman Mythology'; and 'Gruppe, Otto, 'Grieschische Mythologie und Religionsgeschichte' (2 vols., Munich 1906).

SILESIA, sī-lē'shĭ-a (German Schlesien), a former Bohemian duchy, later divided between Prussia and Austria, again divided in 1919 with Austrian Silesia and a small area of German Silesia assigned by World War I peace treaties to newly created Czechoslovakia, and a larger section of German Silesia assigned to Poland. Yet the greater part of Silesia remained part of the Reich. Germany's seizure of Czechoslovak Silesia in 1938 and her conquest of Poland in 1939 brought all Silesia (15,569 square miles) under German rule for the period of World War II.

Silesia is drained by the Oder flowing southeast to northwest. West of the valley are the eastern Sudetic Mountains. East of the Oder the land rises in several more or less isolated and hilly, but not high, plateaus. Nearly nine-tenths of the forests are coniferous. The region is rich in mineral resources. Its coal deposits are among the richest in Europe. Iron and zinc are mined in large quantities and lead and silver are also found. An average annual production of coal in normal years is 40,000,000 metric tons; of zinc, 600,000 metric tons, while of iron and lead considerably less quantities are produced. The climate in the lowlands is favorable for agriculture and the valley of the Oder is very fertile and one of the richest wheat and barley regions in the empire. Oats, rye, buckwheat, potatoes and fruit are also raised in large quantities and there is some viticulture. The textile industry is the most important, next to which follow the metal industries and others depending on mining and quarrying, such as the manufacture of cement, porcelain and glass. Lumbering and the manufacture of paper, beet-sugar, starch and liquors are also important. About 1,600,000 people depend on agriculture for a livelihood, while 1,750,000 are engaged in industrial occupations. Besides the main Oder there are scarcely any navigable waterways. There are about 2,500 miles of railroad. The capital is Breslau (554,-801), which is also the principal industrial centre. Lower Silesia has an area of 10,276 square miles and a population of 3,132,198. Upper Silesia has 3,746 square miles with a population of 1,379,408. Other populous centres are Gorlitz (91,702), Konigshutte (72,000), Beuthen (86,881), and Liegnitz (73,000). The bulk of the population is Roman Catholic.

Former Austrian Silesia was a crownland and duchy situated between the southern part of Prussian Silesia and Moravia and bounded on the southeast by Galicia and Hungary. It measures 115 miles from northwest to southeast, with a breadth of 20 miles and an area of 1,987 square miles. The northwestern part belongs to the Sudetic Mountains, the southeastern to the Carpathians, and in the middle is the transverse valley of the Oder. The chief mineral products are coal and iron, the coa amounting to about 7,500,000 tons annually. Agriculture is confined to the central lowlands and yields grain, sugar-beets and fruit. The industries are more important; there are machine shops, steam textile mills, beet-sugar factories, distilleries, etc. There is a considerable transit trade in Austrian wines, salt and also in beef. Pop. 756,949. Of these 639,000 are Roman Catholics and 102,-000 Protestants. German is spoken by 48 per cent of the people, Polish bv 33 per cent and Czech by 29 per cent. Troppau, the capital, has 31,000 inhabitants. Other cities are Ostrau (22 000), Teschen (22,000) and Bieletz (18,000).

In the 10th century Silesia was incorporated with Poland. In the latter part of the 12th century it was made a separate duchy. In the 13th century the duchy was divided into numerous principalities. By the middle of the 14th century these had become actual vassals of the Bohemian king, and in 1526 they passed to the house of Hapsburg. In 1675 Frederick William, of Brandenburg, laid claim to Silesia. The emperor refused to recognize the claim and

the three Silesian wars followed, which ended in 1763 with the supremacy of Prussia over what later became Prussian Silesia. During the World War I, Austrian Silesia was invaded by the Russian armies. Under the Peace Treaty of 1919, the Czech section of Silesia (area, 1,988 square miles; pop. 756,949) was assigned to the Czechoslovak Republic while Upper Silesia was reserved for a plebiscite. In March 1921 a plebiscite was held in Upper Silesia which resulted in a majority for remaining in Germany. The Poles within the area rebelled and civil strife ensued for several months, France conniving with the Polish insurgents and Great Britain leaning to the German side. The warring factions were at last persuaded to suspend hostilities and the question was referred to the Allied Supreme Council. It met in Paris Aug. 8-12, 1921 and, failing to agree, referred the question to the Council of the League of Nations. A commission was appointed, and its decision, made public on Oct. 20, 1921, divided the plebiscite area in nearly equal parts between Poland and Germany.

The greater part of Czechoslovak Silesia was ceded to Germany as a consequence of the Munich settlement of Sept. 29, 1938. A month later, on November 1, Czechoslovakia signed an agreement yielding to Poland an area of 419 square miles with a population of 241,698. Then, in 1939, when Germany conquered Poland and seized Czechoslovakia, all Silesia came under Reich domination. The Allied victory in World War II brought about restoration in 1945 of Germany's Silesian conquests; but determination of new boundaries for Prussian Silesia had to await the peace treaty.

SILHOUETTE, sĭl-oo-ĕt', is the representation in solid black of the outlines of an object, occasionally with a few assisting lines drawn in white. The name comes from Etienne de Silhouette, French Minister of Finance in 1759. He strove by severe economy to remedy the evils of a war which had just terminated, leaving the country in great exhaustion. At the end of nine months he was obliged to leave his place. During this period all the fashions in Paris took the character of parsimony. Coats without folds were worn; snuff-boxes were made of plain wood; and, instead of painted portraits, outlines only were drawn in profile. All these fashions were called *à la Silhouette;* but the name remained only in case of the profiles.

SILICATES, a great group of minerals. compounds of various elements with silica. The group includes a few important ores but is chiefly significant as the great group of rock-forming minerals. A discussion of the important minerals of this group will be found in the introduction to the article on rocks. See also FELDSPAR; AMPHIBOLE, etc.

SILICIFIED WOOD, a variety of the minerals quartz or opal in which the mineral has replaced the wood. Opalized wood is wood changed into opal; petrified wood includes either of the above as well as wood changed into coal (see PALÆOBOTANY). According to J. D. Dana the trees now silicified in Arizona seem originally to have flourished on the shores of an inland lake, into which they fell and became water-logged; then they were buried beneath volcanic material of a highly silicious character which underwent alteration through the action of water setting free more silica than the water could hold in solution. As the wood decayed this silica was deposited in its cells until finally the woody fibre completely disappeared and what was once wood became quartz. As this change took place only particle by particle, the minutest cells of the wood are preserved and may be seen under the microscope. In the great petrified forests of Arizona, now a government park, there are trunks of trees three or four feet in diameter and over 100 feet in length, completely changed to quartz. Over the whole section are scattered petrified trunks and fragments from the size of a hickory-nut to several feet in diameter. At one place in the park a petrified tree has fallen across a ravine about 50 feet wide, forming a natural bridge. This Arizona petrified wood has been extensively exhibited and sold under the trade names of "jasperized wood," "agatized wood" and "woodstone," having been manufactured into tiles, paper-weights, cane and umbrella handles and many novelties, while complete transverse sections have been mounted as table-tops. The material is partly jasper, richly colored red and yellow by the oxides of iron and partly translucent chalcedony, with occasional spots of clear quartz and amethyst. Silicified wood abounds in the Rocky Mountains, while a similar forest exists in the Yellowstone Park. Opalized wood is also common, especially in California and Oregon. Consult Merrill, 'Fossil Forests of Arizona' (1911). See FOSSILS.

SILICIOUS SINTER. See GEYSERITE.

SILICON, *in chemistry,* one of the non-metallic elements, symbol Si, atomic weight 28.4. Next to oxygen it is the most abundant element found in the earth. It does not occur in nature in the free state but in combination with oxygen (silica) and with oxygen and various metallic elements as potassium, sodium, aluminium, calcium, etc., in the form of silicates. Silicon may be prepared by heating a mixture of metallic sodium and the double fluoride of sodium and silicon ($Na_2SiF_6+Na_4$= $6NaF+Si$); also by action of heat on a mixture of magnesium and silica (sand). It exists in three allotropic forms, an amorphous brown powder, a graphitoidal and a crystalline variety. The amorphous form is insoluble in all acids except hydrofluoric; it dissolves in potassium hydroxide to form a silicate, and burns in the air at high temperatures to SiO_2. The crystalline variety is very hard, is but little if at all attacked by hydrofluoric acid or potassium hydroxide and cannot be burned. Silicon forms compounds with oxygen, sulphur, chlorine and some others but the most important are the oxide SiO_2 and the salts derived from the various silicic acids.

Silica, SiO_2, oxide of silicon, occurs very abundantly in nature both in crystalline and amorphous forms. Quartz, a very pure form of silica, crystallizes in six-sided prisms terminated by six-sided pyramids. The finer crystals of quartz are called rock crystal, while the imperfectly crystalline varieties occur in a number of forms. Of the cryptocrystalline and amorphous forms we have opal, agate, amethyst, flint, sand, etc. Silica can be obtained in a fine

state by melting sand or a silicate with sodium carbonate whereby a silicate of sodium is formed. This is dissolved in water and hydrochloric acid added. Silicic acid separates in a gelatinous condition. The whole is evaporated to dryness, heated for a time a little above the boiling point of water and then washed with dilute hydrochloric acid. The silica is left behind as a gritty white powder insoluble in water and in most acids. Hydrofluoric acid dissolves it, however, with the formation of silicon tetrafluoride (SiF_4). It also dissolves in alkalies to form silicates. Silica is not acted on by heat except that of the oxyhydrogen blowpipe which fuses it. Silica, generally in the form of sand, is used largely in the preparation of mortar, glass and pottery. In metallurgical operations it is used as a flux with ores containing limestone with which it forms a glassy slag which floats on the molten metal carrying with it many impurities from the ore. Silica forms a number of hydrates which have acid properties and from which a vast number of salts are derived. A great many very complex salts of these silicic acids are found in the earth's crust, the metallic elements being usually sodium, potassium, magnesium, aluminium, calcium and frequently small amounts of other elements. Some of the best known silicates are the minerals feldspar, mica, garnet, talc, meerschaum, etc. Clay is largely a silicate. See Quartz; Electrochemical Industries.

SILICON CARBIDE. See Electrochemical Industries.

SILIUS, Titus Catius Italicus, Roman poet: flourished about 25–101 A.D. At Rome he applied himself to the bar, and became a celebrated orator and advocate. He was consul at the time of Nero's death and incurred some reproach for assisting in that tyrant's prosecutions, but acquired honor from his conduct in the proconsulate of Asia, assigned to him by Vespasian, from which he retired into private life, and collected books, statues and busts of eminent men. He finally retired to his seat in Campania, where he died. The only work of Silius which has reached modern times is an epic 'Punica' in 16 books, written with more diligence than genius. It takes as its theme the Second Punic War, according to Livy and Polybius, and contains occasional splendid passages; the description of the passage of Hannibal across the Alps is particularly admired. There are editions by Drakenborch (1717), Ruperti (Göttingen 1795–98, two vols.), and Bauer (Leipzig 1891–92). Consult Butler, H. E., 'Post-Augustan Poetry' (Oxford 1909) and Schanz, Martin, 'Geschichte der römischen Litteratur' (Vol. II, pt. 2, 3d ed., Munich 1913).
